Switch Seals

An elastomeric boot which seals, thus protecting a switch and internal components against hazardous foreign elements. AME's one piece switch seal is constructed of a flexible rubber boot element bonded during molding to a threaded metal insert that fully encapsulates the switch and bushing to the panel.

This assembly replaces the panel mounting nut and seals the mounting hole making it watertight. It protects against moisture, oil, dirt, dust, most solvents, many acids (see elastomer selection guide).

Switch seals provide vibration resistant mounting and act as double insulation with no interference to switch movement.

CAST URETHANE & SILICONE

AME supplies cast urethane and silicone products precision engineered to meet your most demanding requirements.

If you need high tensile/tear strength, excellent resistance to abrasion and high impact capability, our cast urethane is ideally suited for the job. Superb temperature resistance to the damaging sub-zero cold or searing heat extremes is found in the cast silicone custom engineered by AME Corporation.

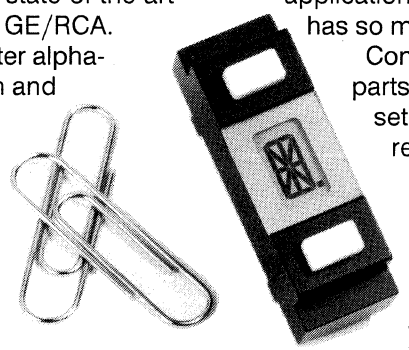
SWITCH SEALS

The world's first intelligent man/machine interface in a DIP . . .

Provides all of the display and switch functions you'll ever need in a single compact device. Stackable and cost-effective.

The secret? A single LSI chip with state-of-the-art CMOS logic. Developed jointly with GE/RCA. Logic that combines a single-character alpha-numeric display, thumbwheel switch and pushbutton switch functions in one easy-to-use component. A true peripheral device with a RAM-like CPU interface.



An intelligent thumbwheel switch that will put you miles ahead of the competition. With capabilities they can only dream about. Unless, of course, you tell them.

In a simple application you might directly replace those out-dated mechanical thumbwheel switches. A typical cookbook design. And without a host CPU.

In a more sophisticated application you might use a host processor to provide programmable control over man/machine interactions. Such as formula selection and entry, display of messages, user friendly menus, or a mix of some or all of these capabilities. The possibilities are limited only by your imagination.

No matter how simple or how complex your application is, no other interactive component has so much to offer and is so easy to use.

Concerned about availability? Standard parts are typically off-the-shelf. We've even set up a second source so that you'll receive an uninterrupted supply.

Got a deadline to meet? Our technical support team will help get you on the air in record time. Or maybe one of our off-the-shelf intelligent thumbwheel assemblies will fit the bill.

Whether you need to make a decision fast, or you're just thinking about down the road. Our microcontroller-based evaluation kit will provide you with instant evaluation, complete documentation and everything else you need to get started. Order one right now and experience intelligent interaction.

To place an order or for more information call: (708) 426-6780.
Please use (312) 426-6780 before Nov. 11, 1989.

EVALUATION/DESIGNER'S KIT

This handy low-cost kit will save you weeks of time. The kit includes everything you need for evaluating, prototyping and designing with this new technology. A MUST for your engineering lab.

Includes a microcontroller programmed to demonstrate the many functions and capabilities of these devices.

The kit includes:

- 15 assorted intelligent thumbwheels
- A microcontroller-based evaluation board with all components (includes a preprogrammed Signetics S87C751 microcontroller)
- Technical data sheets and specifications
- Application notes

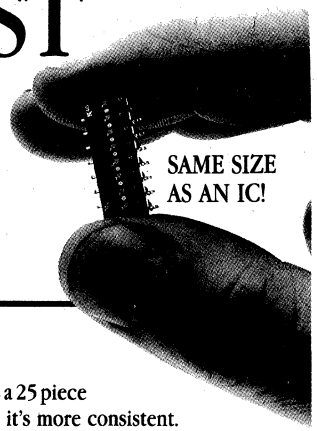
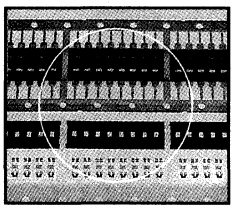
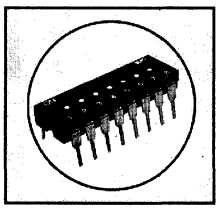
THE WORLD'S SMALLEST SURFACE MOUNT DIP SWITCH!



American Research & Engineering's strip molding process makes for a more reliable switch





It's More Reliable

Three simple components: two composite metal/plastic strips and one plastic molded cover replaces a 25 piece assembly to make a switch that's more reliable because it's more consistent.

SAME SIZE AS AN IC!

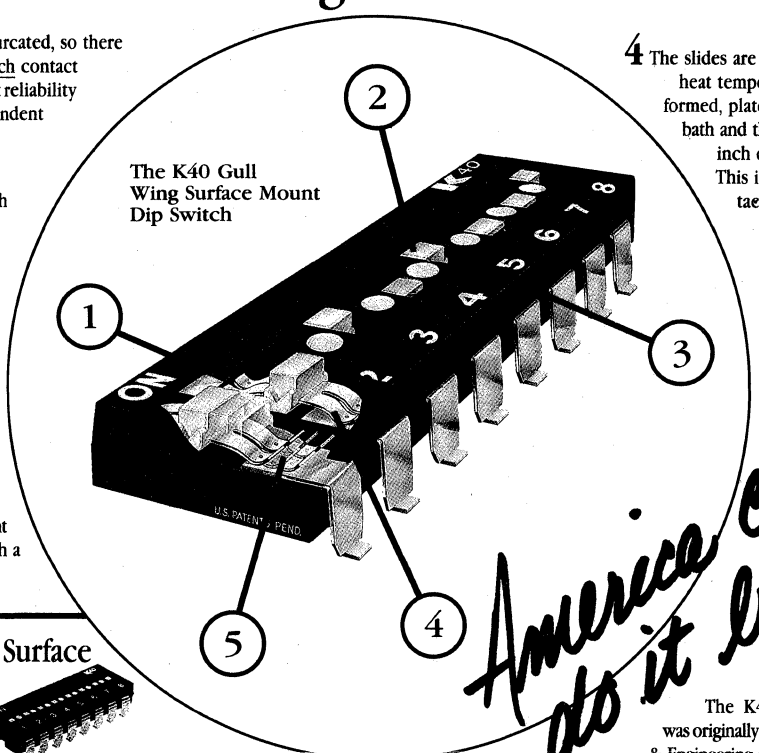
If you don't have automatic insertion equipment, we're banking that some day you will. In the meantime, your board will look neater, better and more professional. And if you have insertion equipment, you'll save the cost of hand insertion!

Three New Patent Designs That Use 40% Less Parts

1 The slides are split, or bifurcated, so there are two separate slides for each contact point. This doubles the contact reliability because you have two independent gold plated contacts at each switch point.

2 The switches are flush with the cover to eliminate accidental, on-off movement once the DIP is programmed. Simple.

3 The package is sealed. The lead frame is molded directly into the housing to provide a one piece, no-leak construction. The cover is ultrasonically molded to the frame after the switch is assembled. There is no better construction. The Surface Mount housing is made of Ryton with a Kapton tape seal.



4 The slides are made from beryllium copper, heat tempered to a full hardness, spring formed, plated in a 100 micro inch nickel bath and then spot gold plated 30 micro inch deep at all the contact points. This is the best proven switch contaet surface that money can buy.

5 Every one of the switch contact surfaces on the main lead frame are plated with 30 micro inch of gold over 100 micro inch of nickel.

America can do it better!

The K40 "J" Bend Surface Mount Dip Switch

Also available for the design engineer trying to save every microinch of board real estate is the K40 "J" bend Surface Mount DIP Switch in positions two through eight.

The K40 Standard Pin Dip Switch

The K40 standard pin DIP Switch was originally designed by American Research & Engineering in 1982 as the world's smallest DIP Switch. It was with its incredible small size and durability that the K40 standard pin DIP Switch led to the development of the new K40 Surface Mount DIP Switch lineup. Lead time for the K40 standard pin DIP Switch is seven to fourteen days and fourteen to twenty-one days for the K40 Gullwing or "J" bend DIP Switch. All K40 switches are manufactured at our plant in Elgin, Illinois.

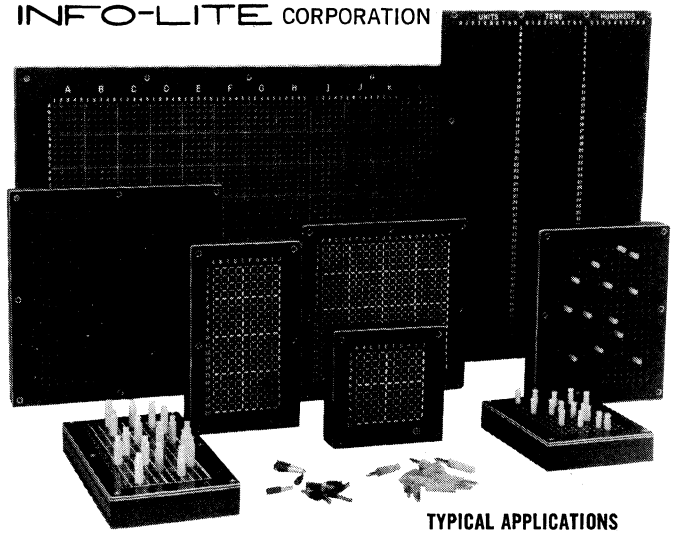
PROGRAMMING PRODUCTS

MATRIX PINBOARDS



INFO-LITE has developed a most convenient, compact and economical system for reliable programming and switching • The Matrix Program Board allows a wide variety of switching/programming functions to be performed by simply inserting programming pins (shorting or diode type) into a 2 to 10 deck contact matrix • No accessories such as "read" "write" equipment are required • Matrix Board features have led them to be favored over such devices as patchboards, card readers, toggle and thumbwheel switches, mag/punched tape and electronic memories • The two basic uses for Matrix Program Boards are: (1) Cordless patching (input-output switching), using shorting pins; (2) Programmable diode matrices (logic memories), using diode pins • Units with up to 100 x 100 crosspoints can be supplied to meet your requirements, whether for prototype or production quantities.

See Data Sheet MB3 for detailed specifications.

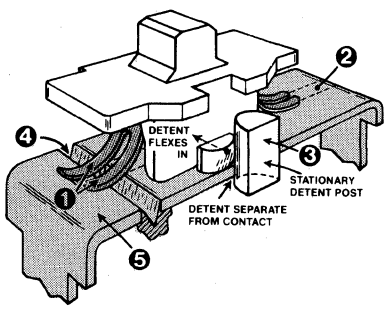
Switch reliability that is the best ever!



1. Redundant gold contacts dramatically enhance contact reliability.
2. Positive wiping contacts assure low and consistent contact resistance. (.050″ travel)
3. Detent function separated from contacts to optimize both designs.
4. Gold contacts never abraded or contaminated by sliding over polymer surfaces. Contacts never touch a nongold surface.
5. No contactor deflection for the life of the switch. Constant contact force eliminates overstressing of contacts for greater reliability.

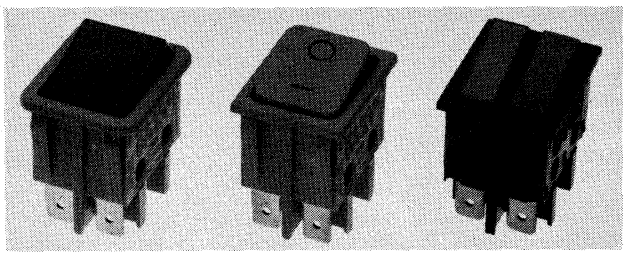
Dreefs

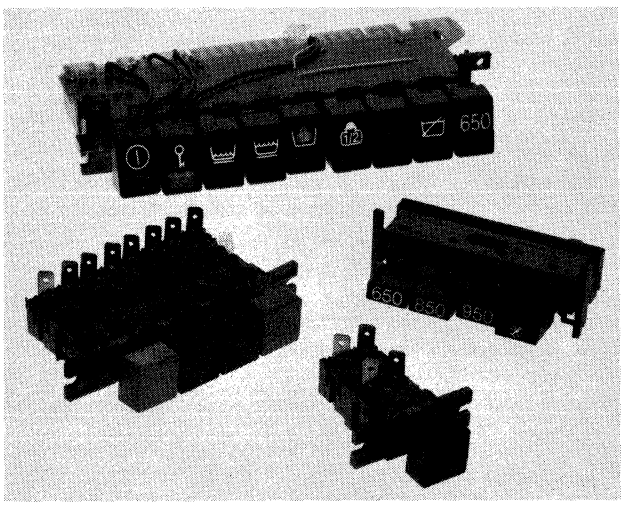
The Worldwide Choice

Rocker Switches



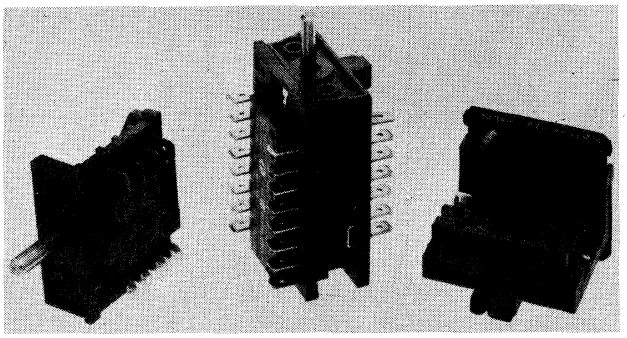
The Dreefs line of power rocker switches ranges from subminiature to full size. Shown above are a few configurations standard within the Dreefs 2WiXII Series. Rated at 16 (4) amperes @250 VAC INDUCTIVE, or 25 amperes @125 VAC INDUCTIVE, this series features an inrush capability of up to 125 amperes (typical). A wide variety of bezel styles and colors, along with many choices for standard and customized rockers (illuminated or non-illuminated) are available.

Pushbuttons

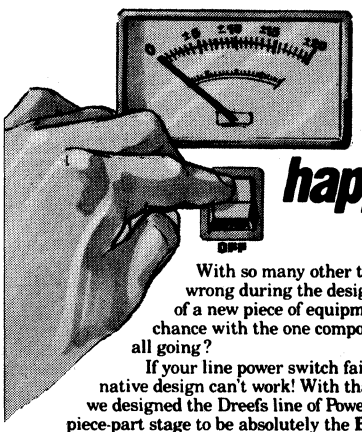


The unique terminal arrangement and building block technique used in the design of these pushbuttons allows easy accommodation of special switching requirements. Each terminal station along the standard heavy-duty thermoplastic housing contains its own set of double contacts, for high reliability and great versatility in switching applications. Each terminal station is rated at up to 16 amperes @125/250VAC. Solid silver, AgCd0 or Au contacts are standard. Operation is momentary, push-push, interlock or cancelling action.

In-Line, Cam Actuated Switch System



The camshaft technique of rotary-to-linear conversion to open spring-loaded NC contacts provides the crisp action, reliability and weld-breaking advantages of make/break contacts, along with high inrush and high current-carrying capabilities. Up to 26 separate SPST switches, each controlling an individual circuit, may be actuated along a single cam, with one to 26 rotational positions. Contacts are rated at 16 amperes @125/250 VAC. High-inrush or dry circuit contacts are available.



What *happened?*

With so many other things that can go wrong during the design and development of a new piece of equipment, why take a chance with the one component that gets it all going?

If your line power switch fails, the most imaginative design can't work! With that thought in mind, we designed the Dreefs line of Power Rockers from the piece-part stage to be absolutely the **BEST** available on the market.

All switches carry a wide array of international approvals, including **VDE, UL** and **CSA.**

Electrical and mechanical specifications are fully described in a newly updated catalog. A telephone call or a note from you will get one into your hands quickly.

By the way, the *outside* of these switches are designed to make your control panel look great too. After the hard part gets done, that's a nice plus.

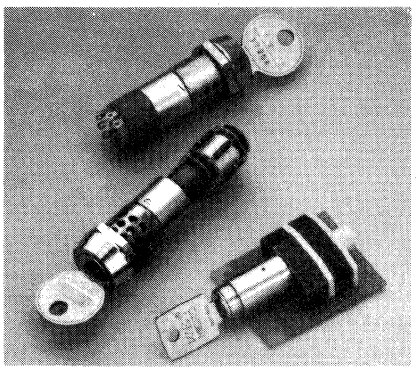
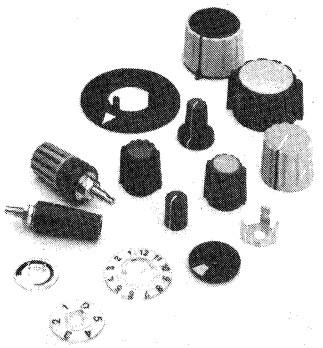
TYPE 01



TYPE 01 AND 06 KEYLOCK



COLLET KNOBS

All **ELMA** switches are designed and manufactured to ensure high reliability and long life. They are in keeping with the strict standards required in medical technology and communications. Common areas of application include process and manufacturing control, measuring and monitoring equipment.

ELMA switches are available in the following forms:

—a broad standard range of rotary switches of different sizes with solder lug terminals or for PCB mounting

—Binary coded rotary switches for PCB mounting

—Binary coded rotary switches for PCB mounting with mounting dimensions according to IC 297/ DIN 41494 standards.

ELMA switches are mainly used in industrial electronics and are especially suitable for switching medium loads, logic levels and dry circuits.

Consequently they are offered with a choice of contact material—gold flashed silver and 3 or 5 μm hard gold. These materials plus the design of the contact ensure high and constant electrical conductivity and good resistance to corrosion and abrasion.

The **ELMA** rotary, PCB, code and key switches are guaranteed to be of the finest quality and to exhibit high reliability and repeatability over many years—this is what has earned us our world wide reputation for excellence.

Miniature Mercury Tilt Switches

- **Versatile** — Available to sense, tilt, vibration or impulses for commercial, industrial or military applications
- **Reliable** — Hermetically sealed, oxygen-free atmosphere provides typical life of 250,000 operations and more
- **Rugged** — Welded metal cases
- **Wide choice** — Omnidirectional or planar
- **Precise** — Operate to tight tolerances

Notes:

1. Response speed depends on the damping fluid used, and is related to jitter reduction. Rated on a scale of 0 to 5, with 5 being heavily damped (longest response time).
2. Switches with other dampening factors are available. Consult factory.
3. Jitter is tendency for switch to change state 3° from operational point. Ranked on a scale of 0 to 5, with 5 being very susceptible to vibrations.
4. Values shown are for switch viewed so that pins are side by side. For values with pins in line (one behind the other) ask for product data sheet.

SPDT AND DPDT SLIDE SWITCHES WITH SEPARATE CIRCUITS (FIG. B)

Rating and materials are the same as the switches in Figure A. In Single Pole/Double Throw switches, each slide operates two adjacent separate circuits, opening one of them, while closing the other. (In Double Pole/Double Throw switches, 1 slide switches 4 circuits at once, opening circuits 1 and 3, while closing 2 and 4, etc.). This circuitry, used in telephone switching systems, makes these switches form, fit, and function equivalents. For true SPDT (DPDT) circuitry, adjacent terminal pairs may be tied with a printed circuit. Dot on the cover indicates the closed position of individual terminal pairs.

SPDT AND DPDT ROCKER AND TOGGLE SWITCHES WITH COMMON POLES (FIG. C, D, E)

Rated to make and break 50 mA 30 Vdc , and 125 mA 30 Vdc for 10,000 operations. Base contacts are copper alloy, gold plated 10 microinches minimum over nickel plate. SPDT (DPDT) circuits are 3 (6) terminal circuits for true SPDT (DPDT) switching and compact spacing. Common pole terminals are marked with a C, and first and second throws are marked as 1 and 2. Military versions are qualified to MIL-S-83504.

High Reliability Supported by Unique Technology.

Flux Scanning Method:

In spite of severe control of the sealing process, there is a slight probability that foreign matter such as magnetic particles may enter the glass. After extensive study in the detection of micro impurities, OKI has adopted the highly reliable flux scanning method. In flux scanning, external magnetism is moved so that foreign matter near the reed is forced to jump to the contact part. The contact resistance then measured is used as the standard for the selection of characteristics. We have thus succeeded in remarkably improving the reliability of reed switches by replacing conventional visual checking with the latest flux scanning method.

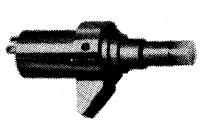
Typical Unique Applications of Janco Rotary Switches

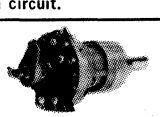


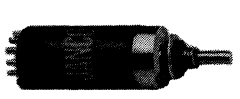
DOUBLE MOMENTARY ACTION

Push button switch designed for grip stick applications. Actuation to first momentary detented position closes first circuit. Second detented position completes second circuit.

FEATURES UNIQUE ON-OFF OPERATION

Actuated by pulling knob out and rotating to "on" positions. While in "on" positions, circuitry cannot be shut off until knob is returned to "off" position and depressed.





MASTER COMMUNICATIONS SWITCH

Provides standard coded outputs and offers unique switching functions by longitudinal shaft movement. Momentary or maintained contact positions actuated by pulling shaft.

JET ENGINE START SWITCH

Knob is depressed and contacts are held in by the solenoid. After jet engine reaches desired RPM, system removes power disengaging solenoid. Lighted knob indicates function.

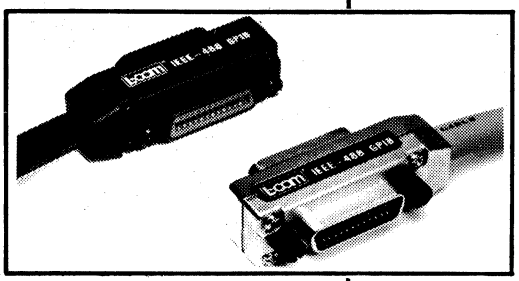
L-COM® IEEE-488 CABLE PRODUCTS

FEATURING: Ultimate design. Cable strain relief prevents tearing.



IEEE-488 Cables - *Meet or Exceed Strict Shielding Requirements*

L-COM General Purpose Interface Bus Cables are designed and built to the latest IEEE-488 Standard, covering "Interface for Programmable Instrumentation". Extreme care has been given to provide a cable that's extremely flexible with plated die cast connector housing and a better than average strain relief to prevent the cable from coming apart when bending at sharp angles. This is a common fault with many GPIB cables in the market today and L-COM has definitely resolved this problem!

IEEE-488 Cables are used to facilitate interconnection of programmable measurement and instrumentation devices to form an integrated system. These cables are designed to minimize cross talk between signal lines, susceptibility to external noise and transmission of signals to external environments. Our GPIB Cables are directly interchangeable with: H-P, AMP, and Amphenol equivalents.

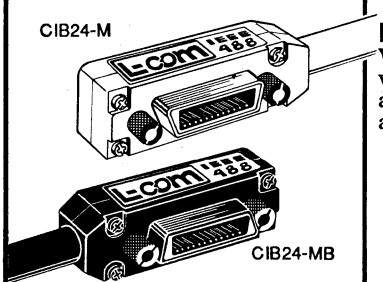
CIB24-M



Deluxe IEEE-488 Cables - *Built to "No Glare" Specs for Specific Industries*

We were urged to produce a series of IEEE-488 cables to resolve the problem of "glare" when used in the vicinity of video cameras, etc. As a result, our best GPIB cables have been modified to include black and anodized cast metal connectors and black interconnecting cable. Now in stock in six basic lengths. See above for specifics of this cable (CIB24 Series) which has 4 shields and is part of our premium line.

IEEE-488 Cables - *Fully Shielded with Molded Terminations*

L-COM offers a second approach to complete the Interface Bus Cable System. Shielding that is not as stringent as in the CIB24 Series, but adequate for most applications. Featuring all-molded connector ends, which contribute to a long life expectancy, and are impervious to breakage at the point where the cable enters the connector housing. Considerable savings can be realized in volume applications.

Molded IEEE-488 Cables - *Same Entry as Leading Makers*

The CMB Cable Series meets all standards of the IEEE-488 interface, conforms with traditional mounting procedure and is directly compatible with H-P, Amp and Amphenol. By traditional standards our cables conform electrically and physically with the cable entrance always approaching from the same direction as illustrated in Figure A at right.

Interconnection Guidelines when using IEEE-488 cables: (1) Total number of devices is 15 or less. (2) Total length of all cables used does not exceed 2 meters times the number of devices connected, or up to a maximum of 20 meters. (3) It's recommended that not more than 3 connectors be stacked on top of each other; the resulting cantilevered structure can cause damage. Damage can be minimized by using L-COM Multi-Tap bus strips (next pg) and (4) Lock screws finger tightened only.

IEEE-488 ACCESSORIES

L-COM®

MODEL	DESCRIPTION	ENTRY	1-9	10-24	25-99

IEEE-488 Accessories - *Carefully Study These New & Useful GPIB Products*

L-COM is first to offer a full line of GPIB accessory products to the industry. Some of these innovative components are proprietary, a direct result of listening to instrumentation engineers and technicians. We believe that you could also find these accessories useful in your day-to-day test or production endeavors. Fabricated from the best materials for a long and useful life, these products will mate perfectly with all our GPIB Cables and equivalents.

Bulkhead Adaptor - *Most Orderly Way to Feed IEEE-488 Cables Thru Panels*

These bulkhead adaptors were tooled and made available because of a need by design and test engineers. This adaptor provides a simplified means of passing a IEEE-488 cable between isolation walls and will also provide access to a console work table. Two basic models are available. The "BA" version has a conventional male/female entry whereas the "BF" version has two female entries which allows more than one cable to be mounted piggy-back on both sides of the panel.

CIB24BA	Male - Female, Bulkhead Adaptor	A	24.50	23.28	22.05
CIB24BF	Female - Female, Bulkhead Adaptor	A	26.50	25.18	23.85
CIB24BFR	Female - Female, Reverse Entry	B	26.50	25.18	23.85

Reverse Adaptors - *Change Cable Direction 180° to Expediate Wiring*

Normally when an attempt is made to mate and extend two standard IEEE-488 cables, the result is that the cables tend to go in the same direction as shown in sketch "A" (right). These adaptors will properly orient the two cables so as to be in line as shown in sketch "B". All metal construction.

CIB24XR	Male - Female, 180° Reverse Adaptor	B	21.00	19.95	18.90
CIB24XFR	Female-Female, 180° Rev. Adaptor	B	21.00	19.95	18.90

Connector Extender - *This Handy Device Provides 1 Inch Added Clearance*

Our extender is sometimes used to provide a one inch extension allowing a cable that extra margin to clear adjoining test apparatus, and to avoid sharp cable bending which may cause permanent damage.

CIB24X	Male - Female Extension Adaptor	A	19.50	18.53	17.55

Connector Covers - *Protect Against Contamination, Physical Damage RFI*

A cast metal cover that mates to the female end only. This cover has many uses such as in production or shipping to protect against dirt or damage to the exposed connector. In the lab, it provides the added service of warning, identifying, or limiting the ports accessibility. One piece cast aluminum construction with two machine screws which are captivated to prevent loss. Quantity pricing available upon request.

CIB24C	Metal Cover, Mates Female GPIB Connectors	4.50	4.28	4.05
CIB24CB	Metal Cover, As Above but Black Finish	4.50	4.28	4.05

Right Angle Adaptor - *Change Cable Direction 90° and Avoid Tight Bends*

This adaptor is handy to have and to use whenever the cable direction needs to be turned 90° to avoid obstacles that demand sharp bends in cable placement.

CIM24RA	Male - Female, Right Angle Adaptor	28.00	26.60	25.20

Multi-Tap Bus Strip - *Allows a Safe and Orderly Cable Placement Method*

Minimize the hazard of piggy-backing and breakage of IEEE-488 connector plugs and sockets. Four or eight female connectors with locking stand-offs accept GPIB cables on a single plane. All connectors are wired in parallel. Simplify and expedite instrument relocations and changeovers. Mount the Multi-Tap on any flat surface or rest on a bench. Built of heavy chrome plated steel and totally shielded to minimize RFI/EMI disturbances. Comes with rubber feet and optional mounting brackets.

CIB24MT	4 Ganged IEEE-488 Receptacles	78.50	74.58	70.65
CIB24MT2	8 Ganged IEEE-488 Receptacles	159.50	151.53	143.55

Rack Mounted Multi-Tap Bus Strip - *Organizes Multiple Interconnections*

A standard 3-1/2" x 19" rack panel containing an eight outlet IEEE-488 distribution panel. This eliminates tangled interconnection cabling so common in GPIB bus systems. Minimizes the need to piggyback IEEE-488 connectors and prevents breakage due to leveraging. Other benefits include; improved cabling, easy tracing of cables and simplified instrument relocation or changeovers.

PR35MT2	8 Ganged Receptacles on Rack Panel	180.00	171.00	P.U.R.

CUSTOM: L-COM is willing to customize GPIB cables to meet your specific needs. Furthermore, we're in an excellent position to offer our services for the development and fabrication of custom accessory IEEE-488 products. We aim to maintain our lead position and to continue our development pace by working with engineers to help us define and achieve many other new product objectives.

MEI T-5 SERIES LIGHTED KEYSWITCHES

DESCRIPTION

The T-5 lighted keyboard switch has long life (greater than 10 million cycles), low bounce, gold-plated cross bar contacts usually found in more expensive switches.

Mechanically, the T-5 switch incorporates precision tracking surfaces providing a smooth "feel" throughout its .170 travel. Each switch has two alignment studs and four to six solder points. This makes hand or wave soldered PC board assemblies extremely rugged for the most demanding applications, while keeping the manufacturing costs down by eliminating the need for metal mounting frames.

Electrical configurations include normally open, normally closed, double pole normally open, and alternate action. MEI stocks a 5V, 60 milliamp, 100,000 hour bulb for these switches. Lamp terminal spacing is .100 inch, to fit T-1 size lamps which can be changed from the front panel by end users. Lenses are stocked in eight colors.

MEI offers a complete line of non lighted T-5 switches and accessories for keyboard construction. These include the switches and keytops shown below, keytops for both 16mm and 19mm center arrays, relegendable keytops, space bars, wide keytops, leveling mechanisms, etc. In house engraving and printing is available for prototyping and low volume applications.

Solid State Hall Sensors

Hall effect sensors respond to a magnetic field, or—in the case of Hall vane sensors—to the interruption of a magnetic field. Hall sensors are not rate sensitive. They operate at extremely high speed and include signal conditioning. They offer high reliability, long life, and compatibility with microprocessors and other electronic circuitry.

Sensors are used in:

- Ignition systems
- Brushless DC motors
- Utility meters
- Water softeners
- Gasoline pumps
- Welding equipment
- Balance scales
- Interlocks
- Flowmeters
- Magnetic card readers
- Vending machines
- Home appliances
- Computer equipment
- Medical instruments
- Copy machines
- Laboratory equipment

SUBMINIATURE/MINIATURE BASIC SWITCHES

SM subminiature basic switches are a versatile collection of small size and ample electrical capacities. SX subminiature basic switches are the smallest snap-action switches available from MICRO SWITCH, yet are big in performance and selection. They provide up to 7 amp power load capacity. V3 miniature basic switches put a 25 amp power load capacity and a choice of 11 other electrical ratings into a relatively small package. V7 miniature basic switches have electrical ratings up to 15 amp power load capacity, and offer two versions—commercial and European designed to meet all leading European approval agency requirements. TB miniature basic switches are small double-break units which offer means of controlling 2, 3 or 4 isolated circuits.

STANDARD BASIC SWITCHES

Power load switching and motor handling capacity are among the attractions of thumb-size BZ/BA standard basic switches. Double-pole double-throw switching is added by DT switches.

Where there's a need for reliable switching of high capacity systems involving DC motors and solenoids, MT magnetic blow-out switches do the job. The 3MN has double-break switching.

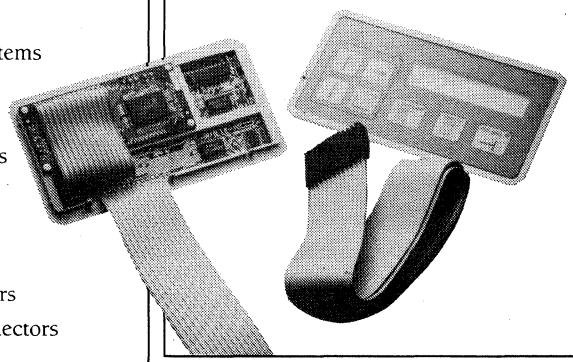
(Control Panels)



Molex offers the highest quality custom and standard control panels for application in television channel selectors, printers, microwave ovens, security systems and other electronic equipment.

Molex's custom hybrid control panels allow integral displays and electronic components to be included in one switch assembly.

Hybrids use a printed circuit board for the lower switch circuit. Electronic components such as LEDs, resistors, and capacitors can be soldered directly onto the switch assembly. The complete plug-in hybrid unit eliminates separate PC board assemblies for each component.

MINIGLOSSARY TIMERS

Accuracy
The variation of unit performance, i.e., time delay, voltage trip point, etc., over the specified conditions of ambient temperature, input voltage range, and time between operations.

Adjustability
The changing of a unit set point, within the specified range of unit operation, by means of internal or external adjustment mechanism (i.e., changing time delay with potentiometer).

Contact Rating
The electrical power-handling capability of relay contacts under specified environmental conditions and for a prescribed number of operations.

Delayed Interval Timing Function
Input voltage is applied continuously. The timing cycle is started by momentarily actuating the control circuit. The functions of separate Delay-On-Operate and interval type timers are combined in one package providing a single OFF-ON-OFF output cycles

Also called: single shot.

Delay-On-Operate Timing Function
Application of the input voltage starts the time delay. At completion of the time delay, the relay contacts transfer.

Also called: Delay-On-Make, On-Delay, Delay Relay, Delay-On-Pickup.

Delay-On-Release Timing Function
Input voltage must be supplied continuously to timer. Actuation of control circuit causes relay contacts to transfer immediately. Time delay starts when control circuit is released. The relay remains energized for the duration of the time delay—then de-energizes.

Also called: Delay-On-Break, Off-Delay, Delay-On-Dropout, Delay-On-Energization.

Frequency Sensor
A device that monitors a predetermined overfrequency and/or underfrequecy condition, and changes output state when these conditions exist.

Hysteresis
The difference between the response of a unit or system to an increasing and a decreasing signal (example: a voltage sensor).

Interval Timer Timing Function
Application of input voltage causes relay contacts to transfer and time delay to begin. At completion of the time delay, the relay contacts return to de-energized state.

Also called: Delay Interval, One Shot.

Output Control
The switching device, either solid-state or electromechanical, used in the unit to control the load connected to the output terminal(s).

Phase Sensor
A device that monitors for proper phase rotation in 3-phase systems.

Programmability
Ability to modify function, time delay or input voltage of a timer.

Recovery Timer

(Delay-On-Operate/Interval Timer)
The minimum time that input voltage must be interrupted *prior* to time-out to insure a successive timing cycle within the specified limits.

(Delay-On-Release)
The minimum duration of time that control circuit must be re-actuated to insure a new timing cycle when the control circuit is released.

Recycle Time

(Delay-On-Operate or Interval Timer)
The minimum time that input voltage must be interrupted after the timing cycle is completed to assure a successive timing cycle within the repeatability specified.

(Delay-On-Release)
The minimum duration of time that control circuit must be actuated to insure a successive timing cycle within the repeatability specified when the control circuit is released.

Repeat Cycle Timer Timing Function
Application of power automatically initiates continuous off-on cycling of the output relay.
Also called: flasher, intervalometer

Reset Time
The time required for the contacts to return to normal position when power is removed.

Reverse Polarity Protection
Blocking circuitry arrangement within the timer to prevent damage or output actuation if reverse polarity input voltage is applied.

Tolerance
The difference between specified and actual timing or sense point (factory setup tolerance).

Transient Protection
Prevents damage to unit if positive or negative transients are applied to the unit. Insures proper operation of the unit during and after transient occurrence. Max. transients are usually specified as to amplitude and duration, i.e., 1000V for 1 second.

Trip Point
The predetermined point at which a sensing device is set to change the output state.

Voltage Sensor
A device that monitors for a predetermined overvoltage and/or undervoltage condition, and changes output state when these conditions exist.

½ INCH SUBMINIATURE ROTARY "C" SWITCH

The Shallco subminiature ½ in. diameter "C" Series combines time proven (over 30 years) internal construction i.e., rotor, stator, wiper, with a cost effective die cast operating shaft and housing.
The Shallco "C" Series switches are designed to satisfy the most demanding industrial and commercial instrumentation requirements.
Shallco offers a unique ½ inch, 3 pole, 4 position, 30° switch and a greater selection of 36°, 45° and 60° switches than any other manufacturer.
The most cost effective switch combines the die cast shaft and housing. However, brass and stainless steel shafts are available and provide the flexibility needed to meet your exact requirements without over specifying. No other manufacturers offers this service.
Our nationwide network of representatives (see EEM yellow pages) is ready to respond to your requirements in an expeditious manner.

Contact Materials — Dry Circuit & Power Switching

Rhodium

Industry standard — recommended for general purpose applications. Low resistance, high melting point metal provides millions of trouble-free operations at low and medium loads.

Gold-Nickel Alloy

Specially developed plating and post assembly conditioning makes this alloy particularly resistant to hostile transients encountered in telecommunication circuits. Suitable for medium and high power loads.

Mercury Amalgam

Precision controlled mercury amalgam ensures contact resistance stability at low level switching over hundreds of millions of operations as required in automatic test equipment and instrumentation applications.

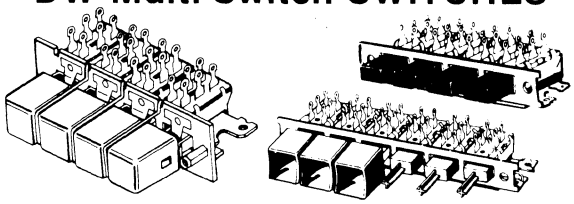
DW Multi-Switch SWITCHES



The DW (double-wipe) Multi-Switch switch is available up to 18 stations in a single row & ganged assemblies with interaction between rows. Max. switching per station is 4-C (4PDT). Each station utilizes specially designed switching modules with U-shaped, high reliable bifurcated contactors rated at 3 amps, A.C.; 0.5 amp, D.C., 125 V, non-inductive load. DW Multi-Switch switches are available in 5 series: 65000, 66000, 67000, 70000, and 71000. All provide four standard functions: **Interlock** — actuating a pushbutton automatically restores to normal the pushbutton previously actuated. **Lock-Out** — prevents operation of more than one pushbutton at a time. This feature is included on all interlock switches. **Non-Lock** — each pushbutton has momentary action. **All-Lock** — all pushbuttons, except release, lock when depressed. All pushbuttons restored to normal by actuating (momentary) release pushbutton. **Push-Lock/Push-Release** — pushbuttons lock when depressed and release when again depressed. **All Series** — pushbuttons on $^{3}/_{8}$" centers. DW Multi-Switch switches are available in single row assemblies with interlock and all-lock functions from one to twelve stations; with non-lock and push-lock/push-release functions up to 18 stations.

Series 65000—Non-illuminated, integral pushbutton.
Series 66000—Non-illuminated version of Series 67000.
Series 67000—Illuminated pushbuttons.
Series 70000, 71000—Non-illuminated, cross-rib plungers, accept up to 12 different styles of pushbuttons.

MOMENTARY Button Switch SWITCHES

Miniature pushbutton switches are enclosed in metal housing. Terminals: solder lug. Contacts: internal nickel silver, 250 mA, 30 W max., AC, non-inductive. **Series 903, 913:** behind panel mtg. **Series 923, 933:** front mount. All switches: bushing mount.

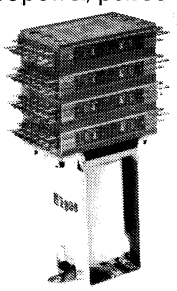
T-Bar THE SOURCE FOR MULTI-CONTACT RELAYS AND SWITCHES

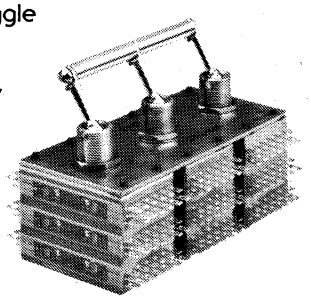
RELAYS

General purpose 800-series, with contact ratings to 5A, and 900-series with low-level to 1A ratings. Both available with 12, 24, 36, 48, and 52 poles in form A (N.O.), form B (N.C.), and form C (D.T.) and 60 poles, form A. Operation from continuous ac or dc power, pulsed power (latching), or solid-state logic. Environmentally sealed and hermetically sealed relays for aerospace, shipboard and ground support hostile environments are available.



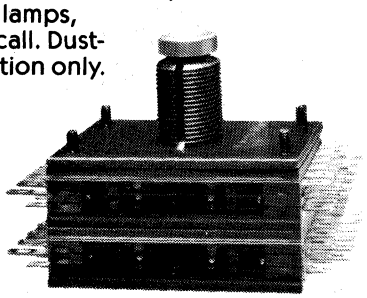
TOGGLE SWITCHES

Same 800-series and 900-series as relays. Available with 12 to 144 poles in form C, maintained action. Typical life in excess of 50,000 operations. Normally dust-tight, T-Bar toggle switches are also available in an environmentally sealed version.



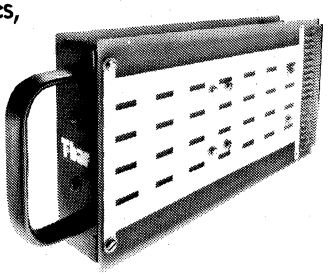
PUSHBUTTON SWITCHES

Momentary pushbutton switches, 800-series only are available with 12 to 36 poles, form C. Typical applications include press-to-test for control panel lamps, reset, and all-call. Dust-tight construction only.



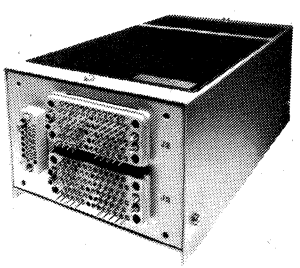
PLUGGABLE MODULES

Pluggable modules use standard T-Bar multi-contact relays in either a one relay configuration or two relays independently controlled with no common failure mode. Plugged into T-Bar printed circuit card cages, any desired switching configuration can be established by backplane wiring.



SELECTOR UNITS

Standard T-Bar relays, 800 or 900-series, are packaged as an automatic selector unit to random or sequential circuit selection and addressed through binary weighted coils. Available as Treeselect (all unaddressed lines remain open) or Norselect (all unaddressed lines connected to a bus), selector units can be provided with 16 to 128 positions.



CONNECTORS

T-Bar plug-on connectors are available for all relays and switches. Each connector provides wiring to one-half of a wafer deck (6 poles; A, B, or C). A 36-pole device, for example, requires 6 connectors. Two connector versions are available. One accommodates individual wiring with crimp-on connectors; the other is used to mass-terminate ribbon cable.

MINIGLOSSARY TIMERS

Accuracy
The variation of unit performance, i.e., time delay, voltage trip point, etc., over the specified conditions of ambient temperature, input voltage range, and time between operations.

Adjustability
The changing of a unit set point, within the specified range of unit operation, by means of internal or external adjustment mechanism (i.e., changing time delay with potentiometer).

Contact Rating
The electrical power-handling capability of relay contacts under specified environmental conditions and for a prescribed number of operations.

Delayed Interval Timing Function
Input voltage is applied continuously. The timing cycle is started by momentarily actuating the control circuit. The functions of separate Delay-On-Operate and interval type timers are combined in one package providing a single OFF-ON-OFF output cycles

Also called: single shot.

Delay-On-Operate Timing Function
Application of the input voltage starts the time delay. At completion of the time delay, the relay contacts transfer.

Also called: Delay-On-Make, On-Delay, Delay Relay, Delay-On-Pickup.

Delay-On-Release Timing Function
Input voltage must be supplied continuously to timer. Actuation of control circuit causes relay contacts to transfer immediately. Time delay starts when control circuit is released. The relay remains energized for the duration of the time delay—then de-energizes.

Also called: Delay-On-Break, Off-Delay, Delay-On-Dropout, Delay-On-Energization.

Frequency Sensor
A device that monitors a predetermined overfrequency and/or underfrequecy condition, and changes output state when these conditions exist.

Hysteresis
The difference between the response of a unit or system to an increasing and a decreasing signal (example: a voltage sensor).

Interval Timer Timing Function
Application of input voltage causes relay contacts to transfer and time delay to begin. At completion of the time delay, the relay contacts return to de-energized state.

Also called: Delay Interval, One Shot.

Output Control
The switching device, either solid-state or electromechanical, used in the unit to control the load connected to the output terminal(s).

Phase Sensor
A device that monitors for proper phase rotation in 3-phase systems.

Programmability
Ability to modify function, time delay or input voltage of a timer.

Recovery Timer

(Delay-On-Operate/Interval Timer)
The minimum time that input voltage must be interrupted *prior* to time-out to insure a successive timing cycle within the specified limits.

(Delay-On-Release)
The minimum duration of time that control circuit must be re-actuated to insure a new timing cycle when the control circuit is released.

Recycle Time

(Delay-On-Operate or Interval Timer)
The minimum time that input voltage must be interrupted after the timing cycle is completed to assure a successive timing cycle within the repeatability specified.

(Delay-On-Release)
The minimum duration of time that control circuit must be actuated to insure a successive timing cycle within the repeatability specified when the control circuit is released.

Repeat Cycle Timer Timing Function
Application of power automatically initiates continuous off-on cycling of the output relay.
Also called: flasher, intervalometer

Reset Time
The time required for the contacts to return to normal position when power is removed.

Reverse Polarity Protection
Blocking circuitry arrangement within the timer to prevent damage or output actuation if reverse polarity input voltage is applied.

Tolerance
The difference between specified and actual timing or sense point (factory setup tolerance).

Transient Protection
Prevents damage to unit if positive or negative transients are applied to the unit. Insures proper operation of the unit during and after transient occurrence. Max. transients are usually specified as to amplitude and duration, i.e., 1000V for 1 second.

Trip Point
The predetermined point at which a sensing device is set to change the output state.

Voltage Sensor
A device that monitors for a predetermined overvoltage and/or undervoltage condition, and changes output state when these conditions exist.

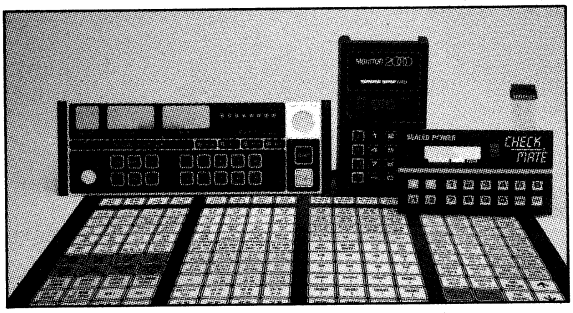
Bergquist Membrane Switches



Bergquist Company designs and builds custom membrane switches especially suited for harsh environments. Bergquist membrane switches are reliable and include the best graphics you can buy.

Bergquist membrane switches are often designed into an assembly to replace conventional discreet switches. Switch panels enable the designer to condense the control area and include more keys than bulky discreet switches will allow and in most cases show a significant cost savings.

Membrane switches are constructed in three different ways to meet the requirements of various applications. Circuitry can be either screened silver ink on polyester substrates or etched copper circuitry on a flexible or hardboard layer. These various constructions can be made with either pressure sensitive adhesives or Bergquist's HeatSealing for harsh environment applications. Screened silver is used for current levels below one watt and copper circuitry is used for current levels above one watt.

FEATURES

Bergquist offers many combinations of features which can be added to the basic switch constructions. These include:

- HeatSeal™ The HeatSeal switch is especially designed for applications with harsh environments. Layers are bonded together with thermoplastic adhesive which completely protects them from contamination.
- LEDs added to the copper hardboard or flex copper switch.
- Embossed domes on silver switches or stainless steel snap domes for copper switches to provide tactile feedback.
- Rim or pillow embossed graphics to enhance the look and feel of switches.
- Backer panels added to the switch panel with optional studs for mounting.
- Adhesive backed switch panels to aid in mounting the switch panel to the assembly.
- A variety of interconnects for both flex circuits and hardboard switches. These include male and female pins, headers, IDC connectors, and others.
- Electroluminescent lamp panels.
- Integral lenses screened into the graphic layer, eliminate cut-outs or die-cut lenses where applicable.
- Special shielding materials such as screened silver, vapor deposited gold or aluminum, aluminum foil or Kapton for EMI/RFI and ESD shielding.
- Deadfront nomenclature which is only visible when backlit.
- Selective textures applied to the graphics layer ranging from rough to matte to non-glare to glossy.
- Hardcoated graphic panels for improved chemical and abrasion resistance.
- Custom color using recognized color matching systems such as PMS, Federal Standard and Munsell or an actual sample to be matched.

THE BERGQUIST LABORATORY

To guarantee the quality and reliability of each membrane switch, Bergquist Company has developed a complete in-house laboratory. The laboratory tests materials, processes and completed membrane switches.

Materials compatibility is a key factor in the reliability of a switch panel. Each material is analyzed and tested alone and in combination with other materials before any construction begins. This is done to prevent interactions between materials after construction, for instance, solvents in pressure-sensitive adhesives could soften conductive silver inks if not carefully controlled during manufacturing.

Along with materials compatibility, the Bergquist laboratory has done extensive testing on the effects of pressure on vented and nonvented switches, hardcoating of graphic panels, membrane switch life, actuation force and modes of failure in dielectric jumpers.

Environmental testing attempts to simulate the field environment of completed switches. Switches are tested under extremes of heat, humidity and pressure. Life testing subjects switches to millions of actuation cycles and graphic panels are exposed to chemicals and abrasives to test hardcoating.

The Bergquist laboratory also works closely with trained quality control specialists to monitor each step of the production process.

ALL NEW with this edition of EEM

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $2.00 for postage and handling. An invoice will be mailed to you under separate cover.

Don't waste any more time. Get organized now!

CONSTRUCTION

GRAPHIC OVERLAY Subsurface printed polycarbonate or polyester. No limit to perfectly matched colors. Surface protected from chemical attack and abrasion with hard coat finishes. Can include transparent, deadfront or colored display windows; selective texturing; embossed, die-cut and/or relegendable areas.

SWITCH Normally open, single pole, single throw momentary contact device, activated by light, direct pressure. Standard encoding xy or common bus.

MEMBRANE Layers of thin, flexible film (printed circuit patterns, insulators and spacers), die cut and laminated with high strength adhesive to form low profile switches. Can be installed to a subpanel, complete with mounting hardware, or fit within a bezel or housing. **Non Tactile** Conductive patterns are printed on the facing, inner surfaces of the two outermost layers, separated, except at the contact pad, by a spacer. **Tactile** Substitutes metal domes (or polyester dome layer) for the top circuitry, as a shorting pad.

PCB Similar to membrane construction, but meets broader electrical requirements and permits board mounted components. Substitutes a PCB for the bottom membrane layer, forming its own subpanel. **Accessory PCB** used to mount components and for accessory circuitry. Mounts directly below the PCB key panel using standoffs.

ELASTOMERIC KEYPAD Used over a membrane or PCB construction. For extended switch life, uses silicon rubber/carbon pills (over a PCB) as the shorting device. Sealed construction ideal for harsh environments. Silent feedback available in progressive feel or positive snap. Under a **plastic keytop,** snap-action metal domes also can be used.

EMI & ESD SHIELDING (optional) Printed or fabricated from copper, aluminum or other alloys.

TERMINATION Unterminated (with terminal pads), solder tabs, male/female connectors; PCB headers or terminal pads.

TRANSPARENT MEMBRANE TOUCH SCREENS xy or analog coding. Construction details and specifications sent by FAX or mail- CALL 206-284-5475

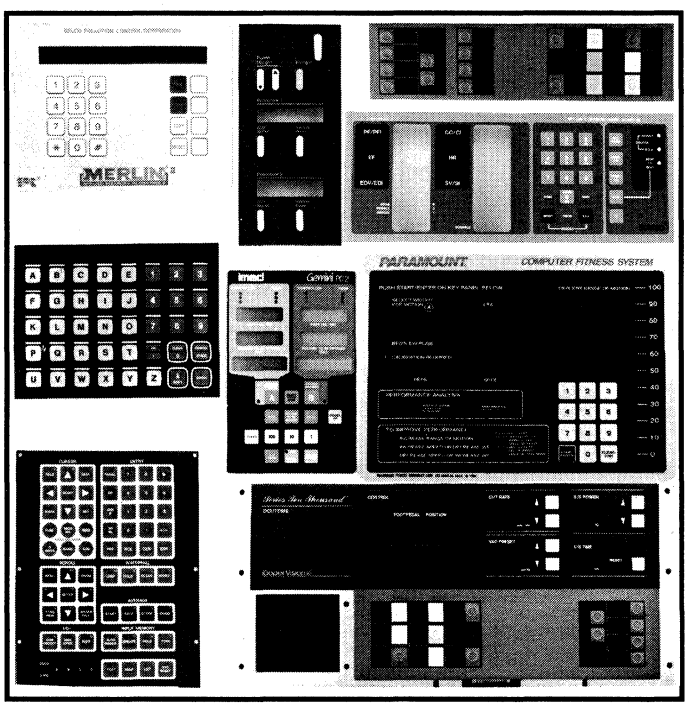
LEADERS IN FLAT PANEL TECHNOLOGY

At Jayco we only manufacture flat panel switch products. This specialization has enabled us to design and manufacture products that are consistently preferred for their visual appeal, switch performance, and quality standards. These products include:

MEMBRANE SWITCHES
KEYBOARDS AND KEYPADS
HYBRID SWITCH PANELS
SILICONE RUBBER KEYPADS



MEMBRANE SWITCHES

Membrane switches are normally open, momentary contact switches. Their light weight and low profile (0.030" - 0.040" thick) make them ideal for use on portable equipment and on rack, console and desktop units where space may be limited.

Membrane switches are more reliable and economical than conventional switching systems and they add design flexibility which simply isn't available with any other switch technology.

Simplicity = Dependability. The switch consists of two contacts, one above the other, separated by a specific volume of air. Finger pressure on the top contact closes the switch, and release of pressure opens it.

The contacts are usually made of printed conductive ink. Therefore, membrane switches are designed specifically for low voltage and low current applications (see technical specifications).

HYBRID SWITCH PANELS

Membrane switches are made of flexible materials. Hybrid switch panels utilize some aspect of membrane switch construction, but are built on printed circuit boards. They are therefore, a hybrid of membrane and PCB technology.

All hybrid switch circuitry is usually contained on the PCB and, switch closure is performed by either a printed membrane or a metal dome (as in a tactile switch).

Hybrid switches can be mounted directly to your chassis with no additional sub-panel required. They can also be supplied as a sub-assembly complete with connectors, hardware and LEDs mounted and ready for installation. Significant savings result from the reduction of the number of components necessary to order, stock, and assemble.

Hybrid switches provide all the advantages of design freedom offered by membrane switches as well as conventional mounting and connection techniques.

KEYBOARDS AND KEYPADS

These simple switch arrays usually do not incorporate all the design features available with custom membrane switch panels. Since Jayco manufactures custom keyboards and keypads to your precise design there are no limitations regarding size, layout, number of switches, circuitry or graphic design. You receive an economical keyboard without standard keyboard compromises.

SILICONE RUBBER KEYPADS

These are an effective alternative to membranes where additional tactile feedback is required. Switch travel is typically 0.040" - 0.060" versus 0.015" for membranes and this is achieved at lower operating pressures. Silicone keypads can be conductive or non-conductive and with integral or separate keytops. Silicone keypads can also be designed into membrane and hybrid switch panels to produce totally integrated front panel assemblies. Call for further information.

FLAT PANEL DESIGN OPTIONS

The following is a guide to aid in the selection of appropriate features. Contact your sales representative regarding any questions you may have.

EMBOSSING

Any part of the front panel can be embossed to add a third dimension. Switch areas are those most commonly embossed.

Embossing is usually pad or rim type. With pad embossing, the entire switch area is raised like a top hat. Rim embossing raises the outline of the switch like a crater. Rim and pad embossing can be combined for special effects.

The type of embossing most appropriate depends upon the application. Pad embossing gives a more conventional keyboard appearance and is generally used with tactile switches. Rim embossing assures better switch location, an important factor in applications requiring a lot of data input.

Unlike many others, Jayco embosses all overlays in-house. Proprietary techniques provide exceptional results, lower tooling costs, and a perfect match between printing and embossing.

TACTILE FEEDBACK

Tactile feedback is the snap action felt at switch closure. It's achieved by the oil can effect of a stainless steel or polyester dome and gives positive feedback of closure. It's important in applications utilizing unskilled operators or where other forms of feedback are impractical.

Jayco makes switches with both stainless steel and polyester domes, depending on the application requirements. Metal domes offer consistency of operation and reliability. Plastic domes are considerably more economical, and make tactile feedback a practical feature, even on large switch arrays.

Our new tease-resistant tactile feedback mechanisms guarantee simultaneous contact and snap with both metal and plastic dome systems. This is a significant improvement over other designs and effectively eliminates the possibility of miss-keying.

SHIELDING

All Jayco panels can be specified with EMI/RFI or ESD shielding. The shielding is usually between the overlay and the switch layer for maximum protection. Shielding materials include metalised polyester, transparent ITO for windows, and printed thick film. Grounding or connection to the shield can be by separate tab, through the connector, or through hardware.

SELECTIVE TEXTURES

This process allows Jayco to offer a textured background with optically clear windows for LCD displays without diecut window holes in the overlay. The process can also be used to highlight particular functional areas of the switch panels. For example, the background can be matt textured with high gloss switch areas. Different graphic treatments within the texture coat can also eliminate other colors. For example, a grid or stripe pattern can be created in the texture instead of using additional colors.

INSERTABLE LEGENDS

Panels can be specified with legend windows behind which you can insert different legends/graphics. This is ideal for user definable keys, different model options, foreign language versions or prototyping. Access to the legend windows can be from the edge of the panel, behind the panel, or from the front.

INTEGRATED DISPLAYS

Through proprietary processes, Jayco can provide one piece or laminated display windows for almost any kind of display device. Windows can be transparent for use with LCDs, or filtered, for use with LEDs or vacuum fluorescent displays. Standard filters are available in red, green, or grey. Other filters available upon request.

In addition to providing windows for display devices we are now able to integrate thin film plastic LCDs within a membrane switch to provide seven segment displays, annunciators and lit switches, all in an assembly less than 0.060" thick. Please call for more details.

DEADFRONT PANELS

Deadfront or secret-til-lit panels are invisible or blank until their displays are lit from behind. This effect is typically used for warning displays, or where a normal display would clutter up the appearance of the panel. Deadfront makes a complex instrument appear simpler to the user while making the displays more effective.

JAYCO QUALITY

Building a switch panel that meets all your requirements means more than following a set of blueprints. At Jayco, quality begins with an analysis of your requirements and the application and environmental details. Only then will appropriate materials, design, and construction methods be determined. All switches must undergo a comprehensive array of tests including aesthetic qualities, mechanical dimensioning, electrical testing, actuation force, and life expectancy. In addition, we have devised systems that ensure batch to batch consistency. These, together with quality assurance systems to provide manufacturing to MIL-I-45208A enable a higher degree of reliability than is available elsewhere.

CONSTRUCTION & FINISHING

DIE CUTTING

Low Key utilizes laser cut steel rule dies. Steel rule die cutting is carried out on all components of the keyboard. Typical tolerance levels of a steel rule die is generally ±0.010 for overall dimensions, and less for die cut holes, key ways, cut outs, and rounded corners.

EMBOSSING

Embossing of the keypad areas on membrane switch overlays is offered by Low Key, to accent key switch areas and to enhance tactile response. Embossed areas can raise circular, square, or rectangular keys more than 0.030 inches above the overlay surface.

TERMINATIONS

Low Key membrane keyboards are most commonly terminated with Dupont/Berg insulation displacement connectors. Common to all flat and flexible circuit connectors, the clincher assembly mates to 0.025 inch pins or headers on a 0.100 center to form a complete interconnection system. Low Key offers other types of interconnect systems in varying configurations and geometry.

SNAPDOMES

Low Key metal snap action domes provide positive feedback over a wide spectrum of operational conditions. Dome sizes range from 0.50 inches in diameter and smaller. Domes are fabricated from a passivated stainless steel spring material. Electrical contact is made when a snap dome is given sufficient finger pressure, causing the dome to snap over into a flattened shape. This forces the dimple to bring the top and bottom circuits into contact with each other. Snap domes are not in intimate contact with the circuit.

Typical specifications on Low Key tactile domes are:

Operational M.T.B.F.	1.0 million
Total Travel	0.015 max.
Pretravel	0.008
Overtravel Nominal	0.007
Trip Travel at Make Point gm	250 gm ±4
Tactile Range	medium

L.E.D.'S

If densities are shrinking, combine size efficient surface mounted L.E.D.'s within your next membrane switch design. Low Key's construction techniques provide unlimited SMD arrays at no increase in assembly thickness, typically 0.035″ to 0.042″.

ELECTROLUMNESCENT PANELS

The durable thin film of the EL panel offers long life, uniform lighting. They are individually addressable, and add as little as 0.011″ to your assembly.

Capacitance	.0035 ufd/in²
Phase Angle	Up to 75 degrees leading
Frequency	60-400 Hz
Voltage	115 AC
Current consumption	0.2-1.0 mA/in²

Low Key's construction techniques provide unlimited SMD arrays at no increase in assembly thickness, typically 0.03″ to 0.04″ thick.

UNIVERSAL MEMBRANE SWITCH/KEYPAD . . . . . .ENCODER. . . . . .

Low Key offers the USE-144 micro-processor based encoder with its custom membrane switch and keyboard products. The USE-144 is software configurable, detecting and encoding up to 144 keys in matrices up to 12 x 12. Selectable output data provides either, PCXT/AT format or in RS232/432 formats. The USE-144 is powered from a single + 5v power supply. No + / − 12v supply is required even for true RS-232 signals. The encoder is uniquely size efficient 1.500″ x 3.500″ x 0.500″ and is easily mounted to the back of your custom membrane switch/keyboard. Complete technical data is available upon request.

A TRUE MEMBRANE KEYBOARD MANUFACTURER

In a class by itself, when your design concept is simple, why take the long way around and settle for less?

Experience and perfection are the keys to providing expert design and manufacturing leadership. At Low Key, we provide you with over 25 years of combined engineering, materials management, and manufacturing expertise.

GRAPHICALLY APPEALING

The modern look of Low Key's membrane keyboards is aesthetically appealing and uniquely stylish. Combinations of graphic materials and processes provide many visual effects, so necessary in this imaginative market.

ECONOMICAL, RELIABLE, & EFFICIENT

Membrane keyboards don't just happen!

We combine old-fashioned one-on-one design review meetings with modern, computer-aided engineering to address each crucial design consideration within hours of schematic validation.

Low Key's efficient size and approach to service is the cornerstone to premium service and quality, but at prices that are well within your budget considerations.

The essence of quality and reliability begins when we design your keyboard. We engineer quality in the lab, not in your customer's facilities. Through research and testing, Low Key maintains continuous vigilance over all materials, processes, and operational keyboard characteristics.

PRINTING

A GUIDE TO SELECTING GRAPHIC OVERLAYS

Low Key graphic overlays for membrane switches and panels can be screen printed in an endless array of colors, utilizing Low Key's vast library of UV ink formulations. Matching colors to PMS standards and special corporate colors is standard procedure.

DIELECTRIC COATINGS

Low Key membrane switches can incorporate dielectric inks for separating portions of the switch from environmental influences. The dielectric coating is a single-component, very-high-solids polyurethane. The dielectric can be applied over or under conductive inks, and will not interfere with their conductive abilities.

FILTERS & LENSES

Transparent inks, in several colors including smoke, can be used to provide filter or lens capability to a membrane switch or panel keyboard. These windows can be clear glossy, diffused, or fluffy textured. This allows light transmission to be controlled from LED or gas discharge displays, which are located behind the display window.

DEADFRONTS

Deadfronts are those portions of the panels or switches where messages, instructions, or read-outs are completely concealed until the panel light is activated. Deadfront graphics are used for aesthetic appeal. Additionally, they tend to draw attention to a particular function or legend when lit. The best deadfront effect is achieved when a black background is used. However, most dark colors and certain shades of grey have been used with satisfactory results. Each application should be evaluated using the actual light that is to be used with the display, in conjunction with the deadfront panel.

ULTRAVIOLET CURING AND TEXTURING

Low Key incorporates UV curing of the graphic sheet to provide selective texturing of the overlay. Hardcoating may be achieved in a similar way, making the overlay extremely resistant to solvents, chemicals, and abrasion. The UV-cured hardcoat is available in a variety of finishes, including clear glossy, matte, and velvet.

Selective texturing of the overlay, with a UV-cured coating, provides visual appeal. This is accomplished by allowing certain portions of the overlay to be textured, while others are left clear and glossy, as in a window or filter area. Textures and colors can be combined to enhance the aesthetics of the final product, while greatly extending the useful life of the switch.

SHIELDING

Printed R.F.I., E.M.I., and static discharge shielding can be provided to protect the electronic components to which the switch is connected. A grounded border, printed on the membrane or a separate printed laminate, can be provided. This may be necessary if there is a likelihood that the switch will be subjected to a static electric charge.

Low Key recommends that in any situation, a thorough evaluation be carried out to determine the effectiveness of R.F.I. and E.M.I. shields prior to production.

LOW KEY IS A CERTIFIED SUPPLIER TO MIL-I-45208A PROVIDING MEMBRANE SWITCHES AND PANELS TO THE MILITARY AND AEROSPACE INDUSTRIES.

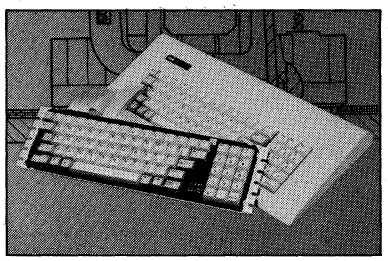
OAK Keyboards and Keypads



Low Profile FTM Keyboards

Measuring just 19.9mm from the center of the home row keycap to the bottom of the aluminum baseplate, Oak's low profile FTM keyboard allows designers to place the FTM in an enclosure and still meet the international 30mm DIN standards.

One of the most notable features of the keyboard is a rocker mechanism which gives a distinct nonfatiguing feel for the keyboard operator. Other features include LED indicators for shift lock and function keys, variable operating force, RFI/EMI/ESD protection, single tail termination and custom encoding electronics. Oak's FTM keyboards can be customized to meet specific design requirements with options in profiles, legends, colors, keycap styles, enclosures and more.

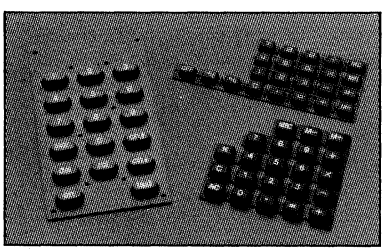
Full Travel Membrane Keypads

Oak's rugged full travel membrane keypads are low cost with high reliability and life expectancy rated at 100 million cycles per key. The keypads are EMI/RFI shielded with a front-sealed design that protects the contacts against spilled liquids, dust and other contaminants. The pretravel and overtravel features promote operator ease, input accuracy and low fatigue.

Available in standard or low profile, Oak FTM keypads are useful in a wide range of data entry applications. The FTM keypad comes in standard sizes of 3″ x 4″, 4″ x 4″ and 4″ x 5″ with a full travel of .160 in. Low profile FTM keypads are available with a .150 in. travel for DIN compatible designs.

Request brochures F-1118 and F-1118A.



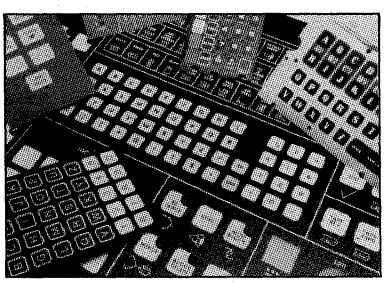
Silicone Rubber Keypads

Oak also offers conductive and non-conductive short-travel rubber keypads in custom versions or standard 3″ x 4″ size. Made of silicone rubber, they are resistant to ozone, corrosion, contamination and puncture. The keypads operate at a temperature range of -40°C to +85°C and perform up to five million cycles depending upon stroke, key pressure and snap effect.

Available with a choice of tactile feel in a key travel range of 0.3 to 6.0 mm, these keypads require an actuation force of 30-260 grams.

In the non-conductive versions, the rubber keypad serves as the switch actuator over a three-layer membrane panel. Conductive keypads utilize a carbon-impregnated silicone "pill" molded on the underside of the rubber dome to accomplish the switching. The conductive switch mounts onto a glass epoxy PC board.

Molded translucent or opaque, the switches are available with custom color options, LED backlighting and alphanumeric or symbolic legends screened onto rubber or plastic keycaps.



Membrane Switches

Oak Micromotion membrane switches offer the ultimate in environmental resistance and flexibility, and come in a choice of many sizes, colors and designs. Tactile feel is also available.

The membrane switch product line consists of two designs. Type A products use rigid single- or double-printed circuit boards. Operating voltage: 1 to 50 (AC or DC). Operating current: 0.05 to 100 milliamps.

Type C products are completely film-based, using a non-rigid polymer-substrate instead of a PC board. Termination is achieved via a "tail" which is compatible with standard commercial connectors. Operating voltage: 1 to 30 (AC or DC). Operating current: 0.05 to 50 milliamps.

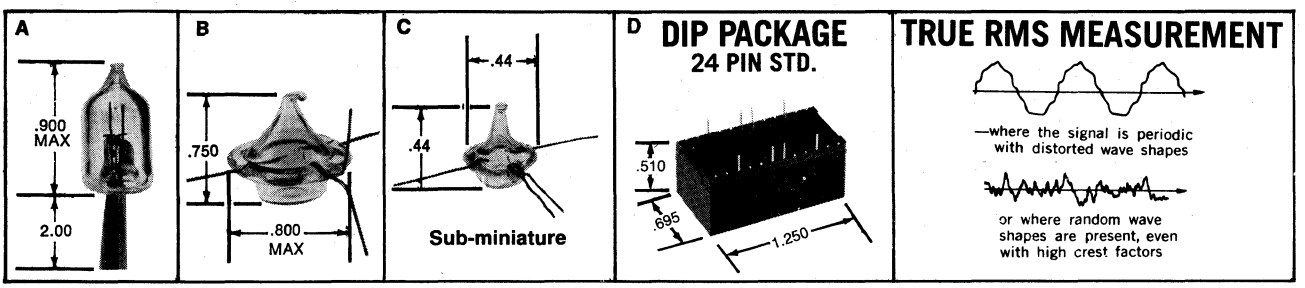
VACUUM THERMAL CONVERTERS



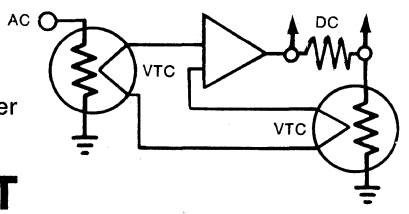
Vacuum Thermal Converters (VTC) provide a simple solution to a difficult design problem. That problem is, economically measuring the true RMS value of a current independently of waveform and frequency.

While VTCs have been in existence for many years, their work is often not understood. The basic structure looks like a simple incandescent light bulb. The outer shell is clear glass. There is a near total vacuum inside. The active elements are a heater wire with a thermocouple suspended at midpoint.

Current flows through the heater wire and the thermocouple measures the temperature at midpoint. This midpoint temperature is proportional to the true RMS current through the heater wire. The ability to calibrate at DC and measure AC accurately is inherent.

Operating range is from 0 to 65 MHz for standard pattern models, up to 300 MHz for UHF pattern and up to 1 GHz for miniature UHF pattern models. Sub-miniature models are supplied in a low profile glass shell.

D package will house one or two sub-miniature units. Ideal for T.C. Control, Spare or Matched Pairs.



Typical application.

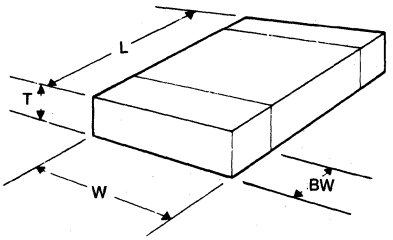
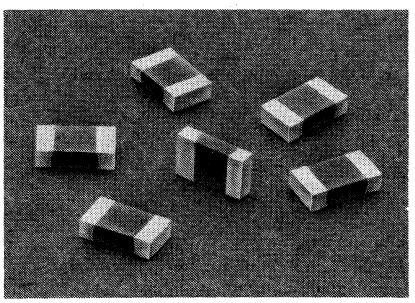
SURFACE MOUNTED HYBRID CHIP THERMISTORS

G, H and J Thermistors – Hybrid Chip

FEATURES

- Wraparound terminations
- Allows design flexibility for use with hybrid circuitry
- High-density monolithic ceramic construction
- Available in 8mm tape and reel





G, H and J Style chips are thermistor dies with wraparound terminations for mounting directly to the bonding pads of a hybrid substrate. The use of low temperature 2% to 5% silver bearing solder paste, or a suitable conductive epoxy is suggested for mounting of G and H Styles. The J Style is suitable to use with standard soldering techniques such as wave or vapor phase.

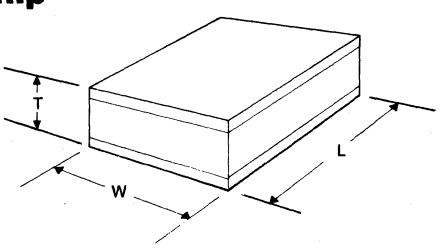
Style G = Palladium Silver
Style H = Silver
Style J = Platinum Palladium Silver

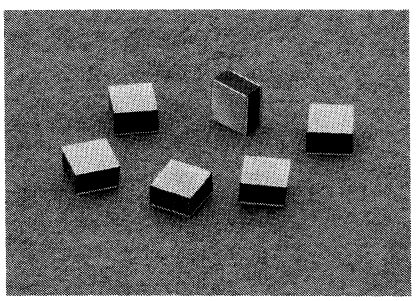
10%, 5% R_{25} tolerance Value range is 5K to 1 Meg. Ω (substitute "G", "J" or "H" in part number according to terminal style required)

W Style Thermistors – Chip

FEATURES

- Top and bottom surface terminations
- High-density monolithic ceramic construction
- Allows design flexibility for use with hybrid circuitry





W style is a thermistor die with silver conductors fired on the top and bottom surfaces. The bottom surface can be reflow soldered or conductive epoxied directly to a substrate bonding pad, and the top surface wire bonded to complete the circuit connection.

W STYLE ±10%, ±5% R_{25} tolerance Value range is 50Ω to 1Meg Ω

***DISSIPATION CONSTANT**
Dissipation Constant expressed in mw/°C, represents the amount of power required to raise the temperature of a thermistor 1°C.

****TIME CONSTANT**
Time Constant, expressed in seconds, is the time required for a thermistor dissipating zero power to change 63% of the difference between its initial temperature value and that of a new temperature environment.

"SOFT START" INRUSH CURRENT SUPPRESSING DEVICES

"Soft-Start" devices display relatively high resistance to starting currents in a variety of electronic circuits. Having a negative temperature coefficient of resistance, these devices exhibit a large decrease in resistance when an AC or DC current is applied.

Unlike circuit breakers and fuses, "Soft-Starts" prevent dangerous, short-duration, peak inrush currents present at turn-on. Especiallly useful in power supplies where charging capacitors initially present extrememly low impedance, "Soft-Starts" actually limit inrush currents thereby extending the life of other critical components.

INTERCHANGEABLE CURVE TRACKING AND POINT MATCHED THERMISTORS

Interchangeable curve tracking thermistors

are "curve matched" to desired temperature tolerances over selected temperature ranges. They allow component standardization and can reduce cost associated with assembly because they are "interchangeable" to within the tolerance and temperature range specified without re-calibration. They are ideally suited for use in microcomputer measurement and control circuits. The temperature tolerance corresponds to a resistance tolerance based on the temperature coefficient at each temperature point within the specified range. Standard temperature tolerance and ranges are listed below, along with the available styles and resistances.

To specify, add the appropriate suffix from the following table to the part number.

Example: 1M1002-B3 = Curve 1, 10K @ 25°C, interchangeable to ±.5°C from 0° to 70°C.

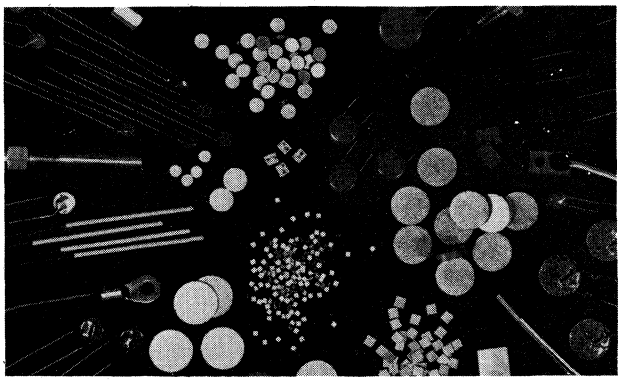
INTRODUCTION

Thermistors are temperature sensitive passive semiconductors which exhibit a large change in electrical resistance when subjected to a relatively minute change in body temperature. Negative temperature coefficient (NTC) thermistors decrease in resistance when subjected to an increase in body temperature. Conversely positive temperature coefficient thermistors (PTC) increase in resistance when subjected to an increase in body temperature. Ketema-Rodan Division manufactures NTC thermistors as well as two basic types of PTC thermistors. The silicon PTC offers a nearly linear positive temperature coefficient of approximately +.7%°/C and the switching PTC thermistor which exhibits a very large increase in resistance (several powers of 10) over a designated temperature range. Their extreme sensitivity to minute temperature changes enables them to perform many unique functions heretofore impossible with standard electronic components.



NEGATIVE TEMPERATURE COEFFICIENT THERMISTORS

The NTC devices are available in resistance values from less than 1 ohm to 1 megohm, and in sizes ranging from 0.010 inch cubes to 1 inch diameter discs. Available configurations include: discs, chips, rods, bars, probes, and resistor/thermistor networks. Units can be molded, dip coated, or encapsulated to your specifications, using packaging materials such as epoxy, glass, or high temperature silicon resin.

SURGE-GARD™ INRUSH CURRENT LIMITING DEVICES

DESCRIPTION

Rodan® SURGE-GARD devices are manufactured of a specially-formulated metal oxide ceramic material which is capable of suppressing high inrush current surges. They are especially useful in power supplies (See Fig A) where, due to the extremely low impedance of the capacitor being charged, the bridge is subjected to an exceedingly high current surge at turn-on. The SURGE-GARD, being of relatively high resistance, limits the current for 1 to 2 seconds during which time the device decreases in resistance substantially to a point where its voltage drop is negligible.

2 I_{max} = The maximum steady state DC or RMS AC current.

3 * RI_{max} = The approximate resistance under maximum steady state current conditions.

4 **Max Operating Temp** = All Rodan Surge-Gard devices are rated for operation to a maximum ambient temperature of 65°C. If your application requires operation above 65°C ambient, please consult Rodan's applications engineering department.

5 **Recovery Time** = Since Rodan Surge-Gards self-heat due to current flow, which in turn causes a reduction in their resistance, the devices require cool-down time after power is removed. The cool-down time allows the resistance to increase sufficiently to provide the required inrush current limiting. This time varies with the particular device, mounting method and ambient temperature. Usually, a one minute cool-down period is adequate. Selection of capacitor bleeder resistors which will provide a one minute or so bleed down time can eliminate the cool down time requirement.

APPLICATIONS

If the resistance of one Surge-Gard does not provide sufficient inrush current limiting for your application, two or more may be used in series or in separate legs of the supply circuit. Surge-Gards cannot be used in parallel since one unit will tend to conduct nearly all the current available. Surge-Gards may be used in the AC (Point A or B) or the DC (Point C or D) locations in the circuit.

SILICON PTC THERMISTORS

DESCRIPTION

The positive temperature coefficient of resistance is very large: approximately 0.7%/°C, making these units ideal for use in temperature-compensating and sensing applications. Just a few such applications include amplifiers, power supplies, transducers, telemetry, computers, magnetic amplifiers, thermometry, meteorology, temperature regulation and overtemperature protection. Lead material other than standard, such as weldable nickel or gold plated, is available on request.

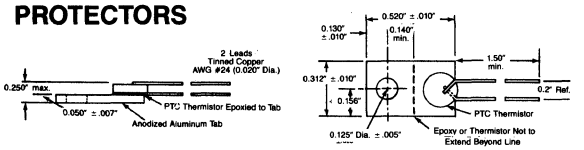
The values for dissipation constant and time constant are for reference only. Mounting method and environmental conditions can affect these parameters.

PTC SURFACE MOUNT OVERTEMPERATURE PROTECTORS



OVER CURRENT PROTECTORS

The PTC over current protector is connected in series with the load which is to be protected. During normal operating conditions, the PTC remains in its low resistance state resulting in negligible attenuation to current flow. When a short circuit or over-current condition occurs, the PTC will switch into its high resistance state thereby limiting the current flow in the circuit to a point well below the normal operating level. When the fault condition is removed, the PTC will return to its low resistance state allowing the current flow to recover to its normal level. Ketema-Rodan Division produces over-current protectors for a whole range of load protection applications.

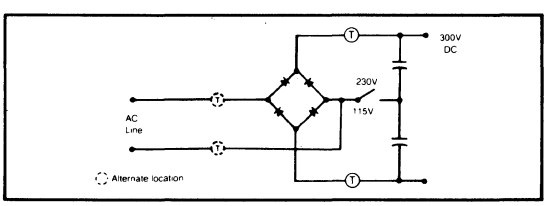
INRUSH CURRENT LIMITERS



The circuit diagram above displays a typical way to limit inrush current.

Protection against extremely high peak inrush current, especially in AC/DC switching power supplies, is now available with Keystone Inrush Current Limiters. These special NTC thermistors effectively control surge currents because the thermal time constant of the current limiter is longer than the electrical time constant (RC) of the thermistor and the capacitor.

All inrush current limiters are insulated with a protective coating.

PTC SURFACE-MOUNT OVERTEMPERATURE PROTECTORS

Positive Temperature Coefficient (PTC) thermistors — act as solid-state switches. A typical application of these surface mount units is to prevent destruction of a power transistor.

The PTC Sensor is mechanically mounted to the power transistor package. The PTC thermistor measures the surface temperature of the transistor. When the temperature of the transistor case reaches a critical point, the PTC switches and turns off the drive circuitry for the transistor. This action prevents its destruction. Then, as the transistor cools, so does the thermistor, automatically resetting itself to once again guard the power transistor.

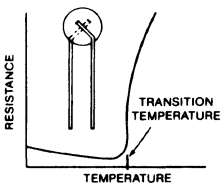
PTC — POSITIVE TEMPERATURE COEFFICIENT THERMISTORS



Positive Temperature Coefficient (PTC) thermistors are characterized by an extremely large resistance change in a small temperature span. The figure at left depicts a generalized resistance temperature plot for a PTC. The temperature at which the resistance begins to increase rapidly is referred to as the transition temperature. This point can be changed from below 0° C to above 160° C.

TYPICAL PTC APPLICATIONS

• Automatic Color TV Degaussing • Air Flow Measurement • Non-Destructive Fuse • Single Phase Motor Starting • Liquid Level Sensing • Combination Heater-Thermostat • Arc Suppression • Time Delay Fusing.

SOLID STATE COOLING WITH THERMOELECTRICS

How To Use Universal Performance Graphs:

APPROACH #1: Convert universal scale values to those of specific module selected:

1. Convert Q_c/GxN (scale values) to Q_c (watts heat pumped): Multiply Q_c/GxN values by module GxN (from table in module specifications chart).

2. Convert V/N values to V (volts input): Multiply V/N values by module N from table.

3. Convert 50 G, 40 G, etc. to I (amps input) values: Multiply 50 by module G, etc.

APPROACH #2: From application, knowing required Q_c, T_c and T_h, select appropriate module:

1. Calculate $\triangle T = T_h - T_c$; select operating current I (I max = 50 G).

2. From universals, obtain Q_c/GxN. Calculate GxN.

3. Select appropriate module from GxN table in module specifications chart.

EXAMPLE: Required Q_c = 31 Watts, T_c = +5°C, T_h = +35°C

1. $\triangle T$ = 35° − 5° = 30°C. Choose operating current (typically from 30 G to 40 G) at 35 G (equals 35/50 = 70% of I max.)

2. From T_h = 35°C graph ($\triangle T$ = 30°, I = 35 G), obtain Q_c/GxN = 1.65; Then GxN = $Q_c/1.65$ = 31/1.65 = 18.8.

3. Choose module with GxN ≥ 18.8; choose CP1.4-127-045 (GxN = 21.6) or CP2-71-06 (GxN = 19.9).

If desired, approach #1 may now be followed for module selected.

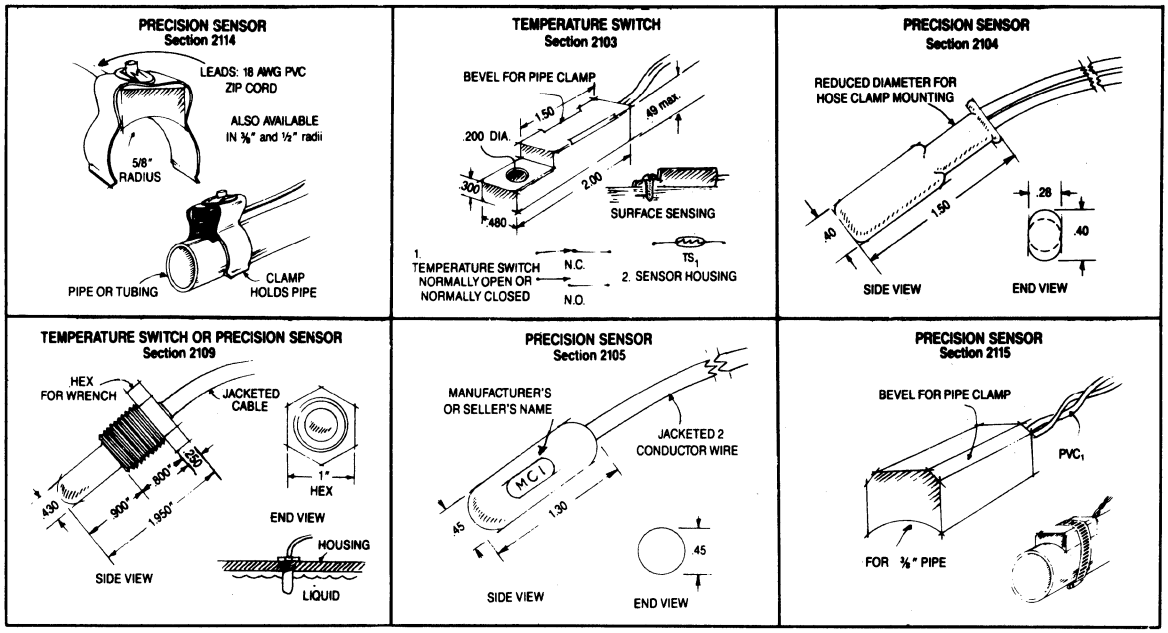
TUFF-SENSORS™

TEMPERATURE SENSORS INCAPSULATED IN THERMOPLASTIC
MANUFACTURED BY MIDWEST COMPONENTS, INC.

TUFF-SENSORS™, a family of thermoplastic molded probes, provide reliable protection against environmental extremes for our line of temperature sensors and switches. Use of high performance plastics creates a temperature probe that resists temperature variations, humidity, chemicals and rough handling.
Many standard sizes and shapes are available, with selection of type based on conditions of use.
Custom designs available to your specifications.

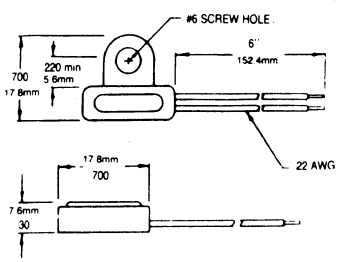


NTC THERMISTORS

MANUFACTURED BY MIDWEST COMPONENTS, INC.

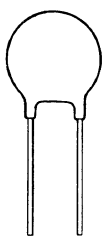
TAB MOUNTED PROTECTORS

Midwest Components' Over Temperature Protectors provide shutoff or regulation of expensive Power Transistors and protect against over-heating that occurs from component failure or short conditions. The sensor is an NTC (Negative Temperature Coefficient) device. Unlike fuses or bi-metal elements its action is recyclable and has no hysteresis effect. Available in resistance packages from 100Ω to 100K in tolerances of .8% to 40%.



INRUSH CURRENT SUPPRESSORS FOR SWITCHING POWER SUPPLIES.

Switching power supplies present high initial currents due to filter capacitor impedance upon turn-on. The use of Midwest's NTC (Negative Temperature Coefficient) devices limits this current to a low value. After current flow their resistance becomes negligible and offers little voltage drop.



• TEMPERATURE COMPENSATION AND SENSING

Disc Series Thermistors are small rugged Thermistors with close electrical tolerances. Their small mass gives short thermal time constants, yet they are not so small that it is difficult to handle them. The tinned copper leads are easily soldered into electrical circuits.

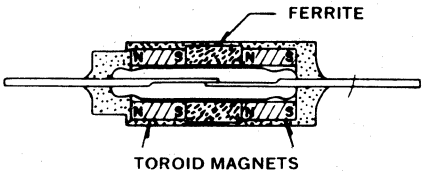
TEMPERATURE SENSING SWITCHES

MANUFACTURED BY MIDWEST COMPONENTS, INC.

CONVENIENT AND RELIABLE TEMPERATURE CONTROL

Miniature temperature switches use an electro-ceramic element instead of a bimetallic switch. The Reed Switch Temperature Sensor works on these two principles: a reed switch actuation occurs because of changes in strength of a magnetic field in the vicinity of the contact gap; and certain materials exhibit great changes in magnetic reluctance when the temperature is varied in the vicinity of the material's curie temperature.

The unit has good response time, and is operable in a variety of atmospheres and solutions. Variations in configurations suitable for installation in automotive engine crankcases and automatic transmissions, or mountings for use in computer cabinets are possible. Other applications include oven over-heat alarms, corrosive liquid temperature control, food freezer thaw warning and cooling fan stop indication. This switch replaces many thermally actuated devices now used where increased life is required or protection of the switching contacts from adverse environments is deemed desirable.



MOLDED SWITCHES

Switches feature small size for fast response. epoxy package resists most chemicals and is good for use up to 115°C. Standard units from 0° to 115°C are available in five degree nominal increments.

REED SWITCHES—PMS SERIES

Midwest Components, Inc. has now packaged the reliable temperature sensing reed switch in a convenient and easy to use housing. The molded plastic body offers the additional advantages of complete moisture and dust protection at an economical price.

This rugged switch can be quickly mounted with a screwdriver. An indentation on the housing also facilitates attachment by ordinary hose clamps or clip hardware supplied by the user. Type A (normally open) or Type B (normally closed) switches may be used in this new package.

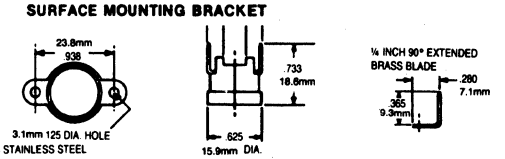
SNAP-ACTION BI-METAL SWITCHES

The electrical switch of the SAS is operated by a thermally-responsive ½inch diameter bimetal disc. The switch is used as a temperature limiting or regulating thermostat. Because of its relatively small size and inexpensive design, it is suitable for a vast array of applications.

SURFACE MOUNTING BRACKET



Features

Impact Action: The bimetal disc of the SAS is factory calibrated at both its top and bottom temperatures. When the disc, which is dished like a saucer, reaches its calibrated temperature it suddenly snaps through and imparts its kinetic energy to the bumper, then to the contacts. The resulting high speed of contact separation insures long life at high electrical loads, and a minimum of radio and TV interference.

SPECIALTY CERAMICS

MANUFACTURED BY MIDWEST COMPONENTS INC

SELF REGULATING DISPLAY HEATER

The unique self-regulating heating effects of specially doped ceramics are utilized to create a new type heater for liquid crystal or other temperature sensitive displays. These devices produce heat at cold temperatures and curtail heating at normal or high temperatures. This feature allows its use in battery operated instruments due to low normal current drain. Use of this heater allows a broader application of displays by removing the adverse effects of temperature.

Heater is attached to reverse side of display with thermally conductive epoxies or silicone adhesives depending upon display's thermal coefficient of expansion or temperature to which it may be subjected. Actual performance of the display will depend upon manufacturers specifications.

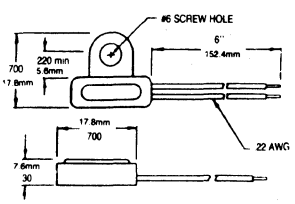
POSITIVE OVER TEMPERATURE PROTECTORS

MIDWEST COMPONENTS' Over Temperature Protector provides shutoff or regulation of expensive RF or AF Power Transistors. Protects against over heating that occurs from output stage component failure, antenna breakage, or short conditions.

Unlike fuses or bi-metal elements its action is recyclable and has no hysteresis effect.



PTC SWITCHING THERMISTORS

MANUFACTURED BY MIDWEST COMPONENTS, INC.

THE POSITIVE WAY TO SENSE, MEASURE, CONTROL, REGULATE AND PROTECT.

MIDWEST COMPONENTS INC. PTC **switching thermistors** are thermally sensitive resistors which exhibit large positive increases in resistance with temperature. At customer specified temperatures the resistance rises abruptly from a low value to a high value. This resistance shift is infinitely repeatable and has no hysteresis associated with its action.

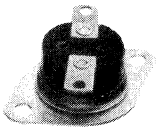
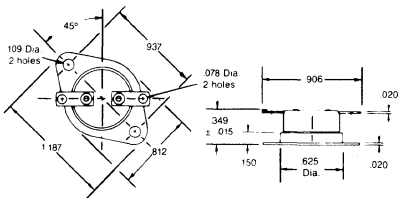
STOCK ½" DISC THERMOSTATS

SC/SO



These compact thermostats are the industry standard. As with all of our snap-action thermostats, a C in the part number means the circuit will close when the temperature rises and an O in the part number means the circuit will open when the temperature rises. Snap-action means reliability. A high-force bimetallic disc inside these thermostats keeps the circuit the way you want it. The thermostats respond instantly to temperature change—not shock, vibration or anything else.



ELECTRICAL
120 VAC, 8 Amps, Resistive

TEMPERATURE RANGE

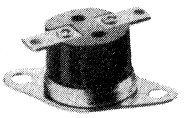
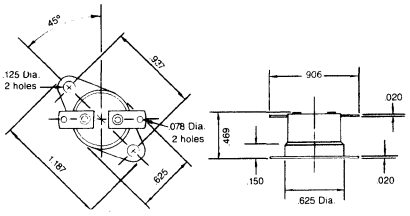
UL File no. E36103, Guide XAPX2
CSA File No. 21048, Guide 400-E-0

SC-A/SO-A



Designed for applications requiring a higher electrical rating, our newest thermostats have the same dimensions as SC and SO thermostats, except they are .12" taller, the mounting holes are .016" larger and the bracket is .187" narrower. The slightly taller thermostat puts more space between the terminals and the base, giving the A model its higher electrical rating and all International Specification Approvals.



ELECTRICAL
120 VAC, 15 Amps, Resistive
240 VAC, 8.3 Amps, Resistive

Also has VDE and all other International Approvals

CA/OA

A breakthrough in price and technology, these thermostats perform under a wide range of operating conditions. One-piece contact construction makes the CA and OA models the most reliable in the industry. They are about the same size as the SC and SO models and are manufactured in a high-tech clean room in Japan. In fact, the CA and OA might just set a new industry standard.

Sensor Scientific has developed a low cost interchangeable wafer thermistor product line. These highly reliable units provide a resistance temperature curve that can be matched within ±.2°C over a range of 0° to 70°C. This means that a matched replacement thermistor can be purchased several years from now with the identical R/T curve as the original thermistor.

NTC THERMISTORS

TEMPERATURE ASSEMBLIES

Sensor Scientific manufactures many different types of thermistor assemblies. The housing drawings in this section are offered as a guide to assist the engineer in designing a complete thermistor assembly that meets his project needs best.

The housing material specified in most of the drawings is stainless steel. If the requirements are such that other material would be preferable, brass and aluminum are also available.

The basic element in these assemblies is the thermistor. Sensor Scientific manufactures a complete line of thermistors. The glass bead probe thermistor and the wafer or thermistor are units that are typically used in these assemblies.

Sensor Scientific has trained application engineers who will assist you in the design and selection of the thermistor assembly that meets your needs best. Our probes have been designed to maximize sensitivity and stability. They are also constructed to minimize the risk of damage due to operation and handling.

All assembly work is performed by carefully trained and supervised individuals. All units are extensively tested throughout the manufacturing process to insure that customers receive the highest quality thermistor assemblies.

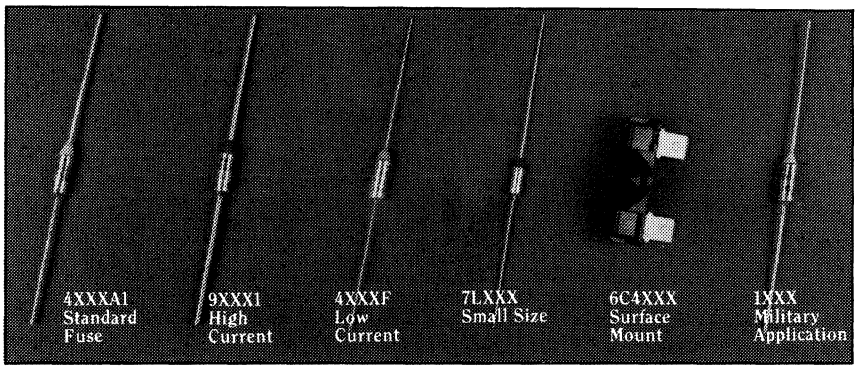
MICROTEMP® Thermal Cutoffs

MICROTEMP Thermal Cutoffs provide permanent over-temperature protection for motors, transformers, appliances, HVAC equipment and electronic equipment. Once a MICROTEMP Thermal Cutoff opens a circuit, it remains open until the fault is corrected and the fuse is replaced.



Thermal Cutoff Series Selection

To determine which series is best for your application, remember:

- To consider the normal and abnormal electrical currents and voltages of your product.
- That the current passing through a MICROTEMP Thermal Cutoff can generate I^2R, self heating. This must be considered when selecting the proper series and opening temperature for your application.
- That the outer case of the MICROTEMP Thermal Cutoff is electrically live and may require insulation. Additionally, since insulation can reduce heat transfer, it also must be considered in selecting the final opening temperature.
- That custom configurations and packages are available.
- That a thermocoupled dummy should be installed in the product circuit to determine the correct temperature setting.

MICROTEMP® Thermal Cutoff Temperature Ratings

Reading the temperature chart.
All MICROTEMP Thermal Cutoffs are identified by their Type No. (4XXXA1, 9XXX1, etc.). The "XXX" digits are determined by the opening temperature you specify. For example: A 4136A1 is a MICROTEMP Thermal Cutoff with an opening temperature of 60°C.

INTRODUCTION

Switching PTC (Positive Temperature Coefficient) Thermistors are thermally sensitive resistors. A PTC will exhibit an extremely rapid increase in resistance (several decades) when heated beyond its switching temperature (Tsw). Standard resistance Ratio-temperature curves are illustrated in Figure 1. Figure 2 illustrates a typical static voltage/current curve.

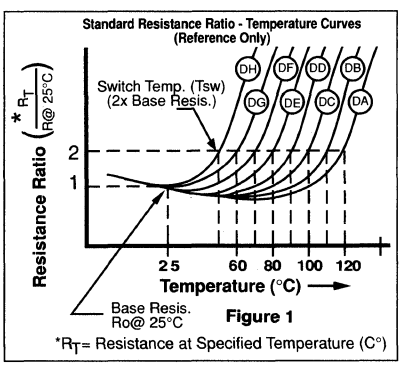

Figure 1

*R_T = Resistance at Specified Temperature (C°)

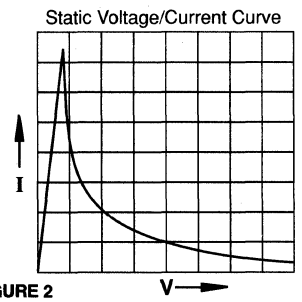

FIGURE 2

TERMINOLOGY

Base Resistance (Ro)
The resistance value of a thermistor at a specified temperature with negligible electrical power to avoid self heating. Usually base resistance will be defined at 25°C. See Fig. 1.

Switch Temperature (Tsw).
The temperature when the resistance of the PTC thermistor reached two (2) times the base resistance, sometimes referred to as curie point or transition temperature. See Fig. 1.

Maximum Operating Voltage (Vmax)
The maximum rated voltage the thermistor can continuously withstand 60 cycle AC or DC.

Dissipation Constant (Dc)
The amount of power through self-heating necessary to raise the thermistor body 1°C (units-Mw/°C)

Time Constant
The time, in seconds, required for a thermistor dissipating negligible power to change 63% of the total difference between its initial and final body temperature when subjected to a change in temperature.

TYPICAL APPLICATIONS

- Transistor Protection
- Motor Protection
- Transformer Protection
- Telecommunication Line Protection

PTC Over Current Protectors are used in series to protect from over current conditions. The PTC will switch from its normal low resistance to a very high resistance state reducing the current flow to a safe level. Once this over current condition has been removed, the PTC will cool to its normal (low) resistance.

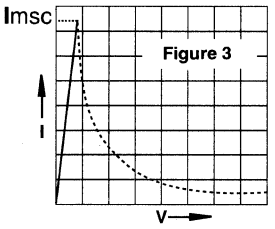

Figure 3 illustrates the Static Voltage/Current curve relationship

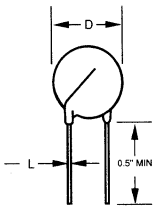

DEFINITIONS

Minimum Switching Current (Imsc)
The minimum amuont of current necessary to switch the thermistor into its high resistance state. Expressed in Amps.

NTC THERMISTORS

NTC (Negative Temperature Coefficient) Thermistors are thermally sensitive resistors which show a large (2 to 6%°C) decrease in resistance as temperature increases. Figure 1 illustrates the resistance ratio-temperature curves of four standard thermistor materials. These materials are manufactured using transition metal oxides that are formed into the desired shape and sintered at very high temperatures (≈ 1200°C).

TERMINOLOGY

Base Resistance (Ro) – The resistance value of a thermistor at a specified temperature with negligible electrical power to avoid self heating. Usually base resistance will be defined at 25°C.

Dissipation Constant (Dc) – The amount of power through self-heating necessary to raise the thermistor body 1°C. (Units in Mw/°C).

Time Constant (Tc) – The time, in seconds, required for a thermistor dissipating negligible power to change 63% of the total difference between its initial and final body temperature when subjected to a change in temperature.

TCR (Temperature Coefficient of Resistance) – Defined by the following equation: and is expressed in %/°C.

$$TCR = \frac{1}{R_T}\frac{(dR_T)}{(dT)}$$

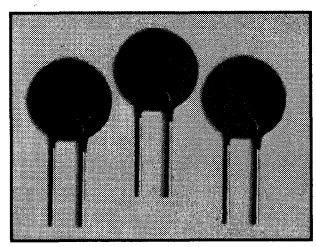
NTC INRUSH CURRENT LIMITERS



Inrush current limiters limit the large initial current present when a circuit is first energized. The relatively high initial resistance of the thermistor acts to limit the inrush current until the power it is dissipating heats it up to a high temperature where its resistance will be reduced to a negligible value.

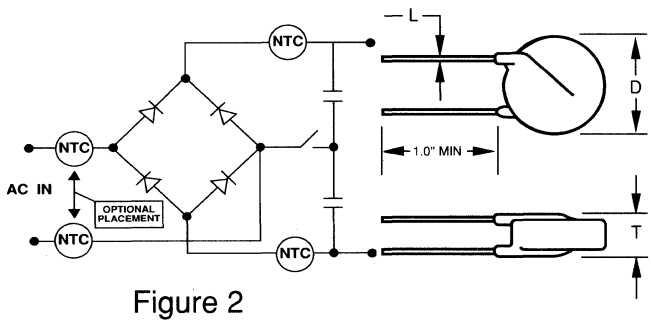


Figure 2

APPLICATIONS

Figure 2 illustrates a typical application in a power supply. The thermistors are placed in either the AC or DC locations of the circuit.

DEFINITIONS

R@Imax-Approximate resistance at maximum steady state current.

Imax-Maximum steady state current (DC or AC)

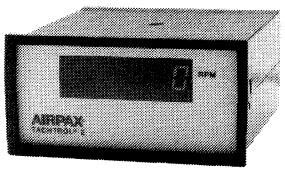
TACHOMETERS AND MAGNETIC SPEED SENSORS

For accuracy, fast response time and reliable, long-lasting performance, specify Airpax tachometers and magnetic speed sensors. Contact Airpax Company, Cheshire Industrial Park, Cheshire, CT 06410. (203) 271-6000. A division of North American Philips Corporation.

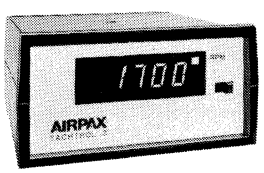


Tachtrol® 2 – Speed/Rate Monitor

A single input digital instrument, this speed/rate monitor offers fast-response, high-precision monitoring. Measured values are displayed in engineering/units: RPM, FPM, frequency or other values. Rugged, easy to set up, yet costs less than competitive models.

Features:

- Single-channel precision speed or rate monitoring.
- Period mode measuring system.
- Five-digit auto-ranging .56″ LED display; full or partial auto-ranging with leading zero suppression. Updates twice per second.
- Active or passive sensor input; accepts any pulse output device, magnetic digital speed sensor.
- Meets MIL-810C shock and vibration.

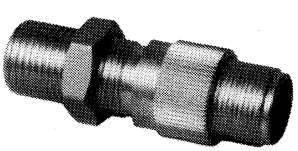


Tachtrol® 3 – Dual Input Digital Tachometer

Single or dual channel instrument, this computing tachometer measures input frequencies and displays the resulting quantities in RPM, FPM, % Draw and other rates. A unique method of setting conversion factors and instrument functions allows easy configuring or altering at any time.

Features:

- Measures speed or frequency (2 Hz to 30,000 Hz).
- Active or passive speed sensor inputs.
- Auto ranging LED display.
- Meets MIL-810C shock and vibration.



1-3111 – Low-Cost Molded Magnetic Speed Sensor

Stainless steel housing and one-piece construction, this speed sensor has interior section coated with epoxy resin to resist both oil and moisture.

Features:

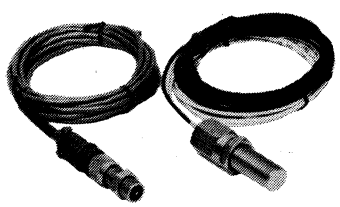
- Wide operating and storage temperature range: −40°F to +300°F.
- 190-volt minimum output (P-P).
- Mates with MS3106A-10SL-4S.

Tach-Pac® 3

The single channel, microcomputer-based Tach-Pak® 3 uses adaptive period averaging which permits a combination of fast response and high accuracy. It measures input frequency and converts the resulting quantities to a meter output, an analog output, and four relays. A unique method of setting instrument functions permits them to be easily configured or altered in the field at any time.

Features:

- Measures frequency from .0625 to 30,000 Hz.
- Active or passive sensor inputs: accepts input from any frequency source.
- Response time – 50 millisecond updates above 100 Hz.
- Field programmable.

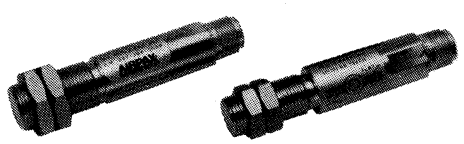


1-0001 and 1-0005 – Passive Magnetic Speed Sensors

Convert mechanical motion to AC voltage. The frequency of the AC signal is exactly proportional to the speed or RPM.

Features:

- No moving parts.
- Wide temperature range.
- Stainless steel housing.
- UL/CSA and FM listed sensors available. Intrinsically safe.



4-0070 and 4-0036 – Active Magnetic Speed Sensors/Zero Velocity

Either speed sensor can be used to sense the speed of any rotating machinery, including motors, generators, turbines, compressors, conveyors – wherever speed or RPMs need to be monitored.

Features:

- Low cost.
- 12V ± 2 VDC power supply.
- −25°C to +70°C operating temperature range.
- 4-0036 is UL listed.
- DC to 10K Hz frequency.
- UL/CSA listed sensors available.

Hall Generators

DESCRIPTION

The F.W. Bell series of Hall effect magnetic field sensors consists of 29 standard models designed to meet the requirements of most magnetic field measurement applications. The sensors are small, solid-state devices. They produce a voltage which is proportional to the product of the control current and the magnetic field component normal to the Hall active area. Each unit has four electrical connections. Two carry the control current (I_C) and the other two supply the Hall voltage.

These models are built in various configurations to measure axial, transverse, and tangential magnetic field components. Their operating characteristics permit virtually any application: frequency, dc to MHz; magnetic flux density, milligauss to kilogauss; linearity to 0.1%; temperature, -269°C to +100°C.

This schematic representation illustrates both the measuring and multiplying capabilities of a Hall generator. By holding I_C constant, V_H becomes a direct function of B, the magnetic flux density. If both, I_C and B are variable, V_H is proportional to the product of the two functions. Holding B and I_C constant, V_H becomes a function of the angle between B and the plane of the Hall-generator active area.

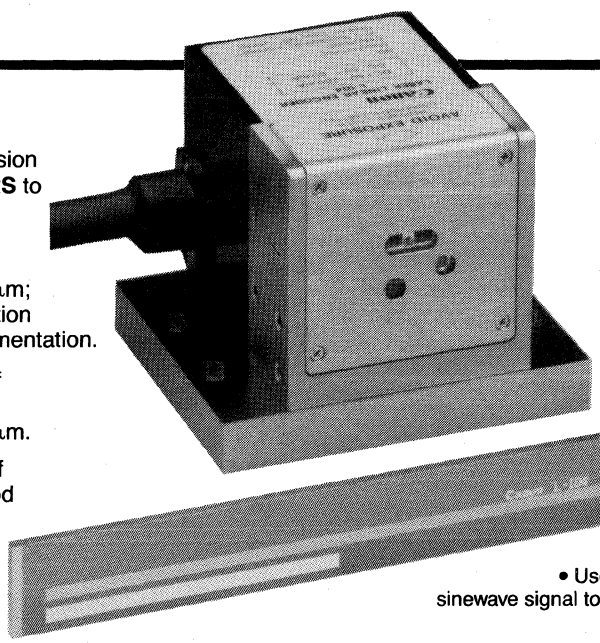
Canon Laser Linear Encoder

0.01μm RESOLUTION. EASY TO INSTALL.



Canon has added high-precision **LASER LINEAR ENCODERS** to its full line of laser rotary encoders. The Canon laser linear encoder provides for maximum resolution of 0.01μm; thereby allowing high resolution closed loop control of instrumentation.

L-104 has a scale slit pitch of 1.6μm and sinewave period output from main unit of 0.4μm.

L-108 has a scale slit pitch of 3.2μm and a sinewave period output from main unit of 0.8μm.

A 16 signal interpolator CI16-2 and 40 signal interpolator, CI40-2 are available, enabling optimum combinations to achieve various resolution and responsiveness.

FEATURES:

- Interference by fine grating with a semi-conductor laser achieves resolution equal to that of laser interferometers.
- Reflection-type, allowing easier adjustment of alignment as compared to the transmission type.
- More stable under variable ambient conditions compared to conventional laser interferometers due to the use of a scale method instead of the laser wavelength standard method.
- Zero-phase index signals are output, allowing simple control of positioning.
- Uses interference, thus providing a full sinewave signal to be obtained from the photodetector.

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $2.00 for postage and handling. An invoice will be mailed to you under separate cover.

Optical Incremental Encoders

DISC INSTRUMENTS specializes in providing modular, enclosed, and panel mounted optical incremental encoders for position and velocity sensing applications. These encoders feature an exceptionally accurate quadrature output, minimal PM error, high frequency response, minimal edge jitter and low power consumption. These characteristics, combined with long term stability, makes these encoders ideal for a wide variety of motion control loop applications.

Keyed to the high performance and low cost features of these encoders is the incorporation of DISC's integrated optoelectronic technology. The sensor array and the optoelectronic signal processing integrated circuits are mounted on a .40" square hybrid circuit. All passive components are surface mounted on a printed wiring board.

High reliability and accuracy are assured by the use of state of the art robotic equipment to perform most of the encoder assembly and the use of resistor laser trimming for its calibration. Reduced component count due to the integrated optoelectronic circuitry also greatly enhances reliability.

Standard encoders do not always meet specific design requirements. For this reason, DISC INSTRUMENTS has developed an in-house optics shop, machine shop, prototype shop, and life testing lab in order to develop encoders to meet unique applications requirements.

The advantages of being tiny.

At Entran, we've solved most of the problems you might encounter with pressure transducers by making them tiny. And nowadays, tiny is the state-of-the-art.

Being tiny means you don't interfere with the integrity of the system being measured.

Being tiny means less measuring surface to bear loads, and a more compact solid state density with no moving parts.

Being tiny means being insensitive to acceleration, vibration and shock, so you get flat pressure readings, both static and dynamic.

And, being tiny means greater handling ease in hard-to-get-at places. Which adds up to more applications flexibility.

Entran pressure tranducers can usually be interfaced directly with scopes, recorders and milliammeters.

Our transducers come complete and ready to use. All you need supply is the excitation voltage on two leads and read output on the other two leads.

All units give you direct linear output in millivolts/psi and read both static and dynamic pressures. There's no need for charge or voltage amplifiers. Calibrations are traceable to The National Bureau of Standards.

The advantages of being tiny.

At Entran we build a line of accelerometers that can best be described as tiny.

Being tiny means you don't interfere with the integrity of the system being measured.

Being tiny gives you greater handling ease in hard-to-get-at places, which adds up to more applications flexibility. And, being tiny means less mass to distort your test scale, more room for other instruments. All at no sacrifice in test data.

Entran accelerometers give you high output, low impedance readings, both static and dynamic. As a result they can usually be interfaced directly with scopes, recorders and milliammeters.

Entran accelerometers come complete and ready to use. All you supply is the excitation voltage on two leads and read output in millivolts on the other two leads.

All units give you direct linear output in millivolts/g and read both static and dynamic acceleration. There's no need for charge or voltage amplifiers. Calibrations are traceable to The National Bureau of Standards.

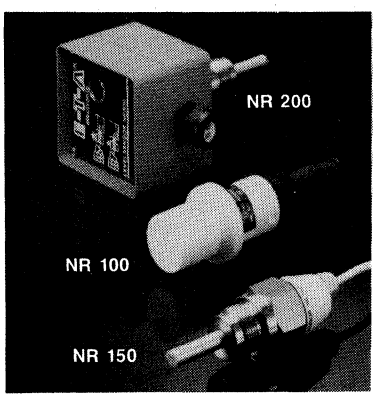
LEVEL SENSORS



Level Sensors NR 150 and NR 200 are fully electronic and have no moving parts (except the output relay in model NR 200). Model NR 100, with Teflon® sensor head is also offered for food industry applications. The devices operate on the capacitance principle. A tunable oscillator circuit is ON when the probe is immersed, keeping the output conductive (relay output NR 200, transistor output NR 150). The indicator LED is now lit. When the level drops below the sensor position, the LED will extinguish and the output relay will drop out. Transistor output of model NR 150 is now non-conductive.

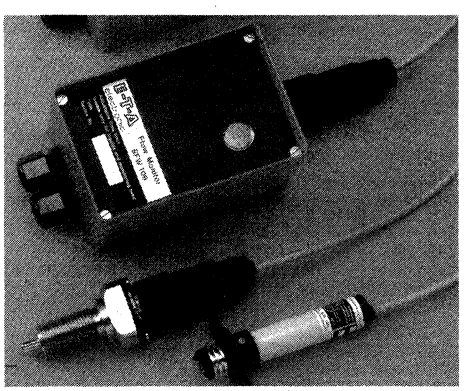
FLOW MONITORS



The E-T-A range of Electronic Flow Monitoring Systems has been designed to supervise the flow rate of gases and liquids in pipelines. There are no moving parts in the flow stream, thus these systems are particularly suitable for liquids of high viscosity or containing particles in suspension. Corrosion resistant monitoring heads are also available for aggressive liquids/gases.

Typical applications for E-T-A Flow Monitors include the control of lubricating, hydraulic and cooling systems and the requirements of the petrochemical, food processing and brewing industries when flow control is often associated with the correct dosage of ingredients.

The systems operate on the calorimetric principle i.e. heat transfer between two probes is detected as a function of flow rate.

The heart of all Hamlin magnetic proximity sensors is a precious metal contact reed switch, sealed in a glass envelope for environmental integrity and dependability. When a magnetic actuator is placed within a prescribed proximity of the sensor, the switch contact changes state. Their cost is far below inductive or capacitive proximity sensors and they require no power to operate and provide a switch closure output.

For detailed product information request the Hamlin Magnetic Proximity Sensor Catalog. The 16 page brochure provides complete data about Hamlin's broad family of standard Magnetic Proximity Sensors plus application and design recommendations. Also included are dimensions, electrical specifications and operation characteristics.

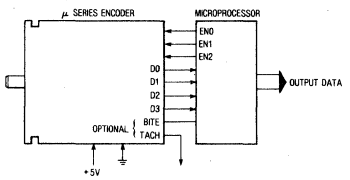
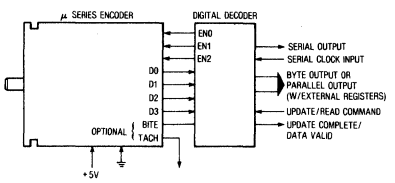
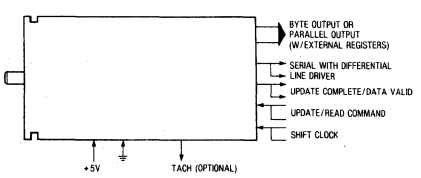
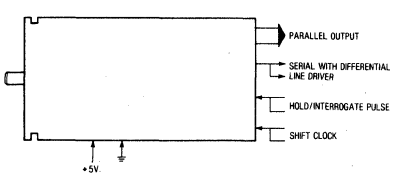
VERSATILE INTERFACE









L MODEL

The L model is the basic encoder configuration which outputs a 4 wire multiplexed, 3-State Logic Level MicroSeries Code Word. the encoder is addressed by 3 Enable Lines activated in a controlled sequence. This model is intended for direct interface with a user (or Itek) furnished microprocessor where the microprocessor can be programmed to perform the encoder's digital logic functions.

LS MODEL

The LS model consists of the basic L encoder (described above) and a separate Digital Decoder. The use of the external Digital Decoder is suggested when the user does not have a microprocessor available to perform the digital processing of the outputs of the L Model encoder or when the length of the LC encoder exceeds available space in the intended application. The external digital decoder also affords the user the flexibility to access the various input/output programming modes available with MicroSeries encoders. The Digital Decoder can be user programmed for three output modes: serial, 8 bit bytes, or parallel with strobe signals to latch user supplied external registers. Additionally, two data acquisition modes are possible: Update and Read.

LC MODEL

The LC Model contains an Integral MicroSeries Digital Decoder Chip. This model, essentially similar to the LS, is appropriate when an encoder without external processing circuits is desired. The same output and data acquisition modes as the LS Model are available but are built in at the factory for the LC Model.

K MODEL

The µS/23K Model encoders are *low cost* absolute encoders which provide 12 or 13 bits resolution with either parallel or serial output. In the parallel output mode all bits are continuously available. The HOLD pulse prevents any bit from changing state while the encoder is being read. In the serial output mode the user provides an interrogate pulse which provides the hold function and loads the shift register. Shift (clock) pulses provided by the user serially shift out the stored information.

CLASSIFICATION AND MAIN APPLICATIONS OF PIEZOTITE®

Material	Outstanding Feature	Main Application
P–3	A most broadly used material having barium titanate as a main constituent mixing other components to improve temperature characteristics around normal temperature.	For powerful ultrasonic oscillation such as cleaner, processing equipment, etc., fish finder, underwater sounding equipment, etc.
P–5	Titanate-zirconate is used as main constituent. Electromechanical transformation efficiency is great. This material resists against a high temperature of 200°C and has an excellent aging resistivity.	Powerful ultrasonic oscillation and high pressure generation such as for high-performance and high temperature cleaner or processing equipment, etc.
P–7	Like P–5, titanate-zirconate is used as a main constituent. P–7 has a greater electromechanical transformation efficiency than P–5. Especially, this material is suitable for application into nonoscillating system for its low mechanical Q.	Record player pickup, microphone, aerial ultrasonic equipment, high band resonator, etc.

ALL NEW with this edition of EEM

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $2.00 for postage and handling. An invoice will be mailed to you under separate cover.

Don't waste any more time. Get organized now!

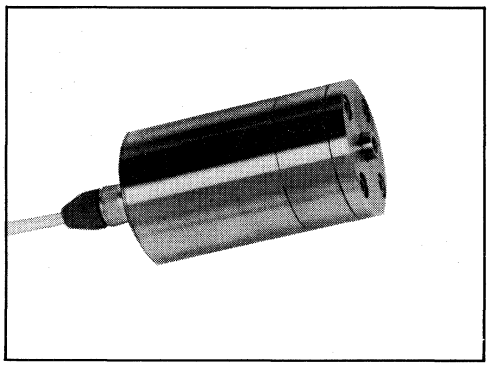
TRANSDUCERS & SYSTEMS

Specialists in transducers and systems for low range force/weight measurements

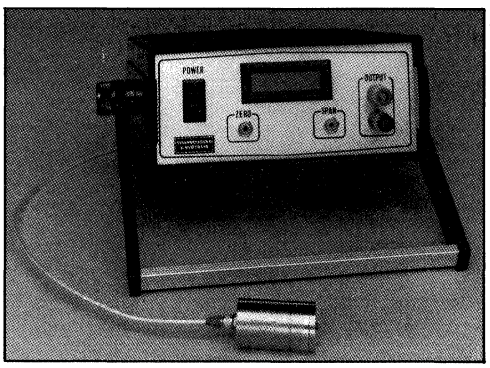
A PRIME TECHNOLOGY COMPANY



LOW RANGE FORCE/WEIGHT TRANSDUCERS

- **Highly repeatable — .02% F.R.**
- **Frictionless sensing**
- **Virtually indestructible**

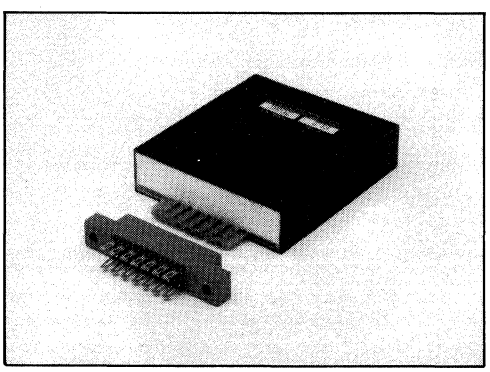
A virtually indestructible frictionless spring-loaded design has been proven in a wide range of applications — from demanding high volume arm flexture gram force calibration for disk drive manufacturers where durability and dependability are required . . . to sophisticated medical laboratory developments where pinpoint accuracy and precise repeatability are a must.



SIGNAL CONDITIONING CONTROL BOXES

- **Push-button Zero**
- **4½ Digit Display**
- **Span Adjustment**
- **AC Power Line Operation**

The CB14 control box is a highly flexible bench-top AC line-operated system. A 4½ digit LCD indicator and standard calibrations give a direct visual representation of measurement in grams of force or inclination related to the sine of the angle. Front panel accessible offset and scale potentiometers allow adjustment of any deviation experienced through mounting.

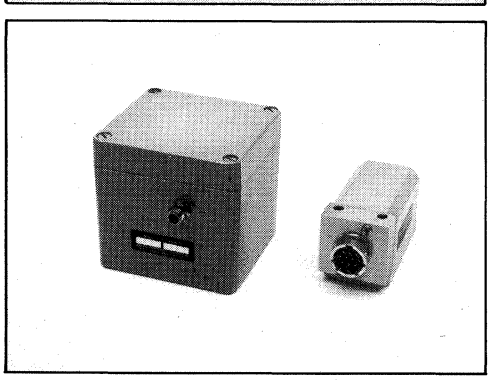


SIGNAL CONDITIONING MODULES

- **Flexible**
- **High resolution output**
- **Designed for use in existing OEM applications.**

These EL Series modules eliminate the need for developments of custom circuitry where DC to DC operation is desired. They provide a carrier-oscillator-demodulator filter and amplifier to provide a sharp, high resolution output. The unique EL2 has provision for remote offset and scale potentiometers as opposed to the more conventional EL3 with on-board adjustments.

Note: AC line, cord-operated, ±15VDC output power modules are available for use with EL2 and EL3 units.



INCLINOMETERS

- **From ±5° to ±90° with 360° axial capability**
- **Resolution of 0.1 arc-second**
- **Fast response, low hysteresis, high stability, high accuracy**

The HO Series of inclinometers utilizes a frictionless assembly for measuring deviation from horizontal, with immediate response, virtually infinite resolution and no cross-axis sensitivity. It is an LVDT-based spring mass system with core material centered on a non-magnetic stainless steel shaft with two mass weights equidistant on either end. The HO-C Series is a more moderately priced alternative to the HO inclinometer that meets the performance standards of most applications.

US DIGITAL Softpot™ Optical Shaft Encoders

The Softpot optical shaft encoder is a **non-contacting rotory to digital converter.** Useful for **position feedback** or **manual interface**, the Softpot reports realtime shaft angle, direction and speed. It is a practical solution to the wear, contact bounce and digit bobble problems associated with pots and A/D converters.

The Softpot utilizes an **unbreakable** disk, **metal** shaft and bushing, **LED** light source and operates from a single **+5** volt supply.

Available with **ball bearings** for motion control applications or **torque-loaded** to provide the feel of a limitless potentiometer for front-panel manual interface.

Call for updates on our **index, through-shaft** and **motor mount** versions. We have no minimum orders. Engineering orders (including special shafts) normally **ship within 24 hours.**

ALL NEW with this edition of EEM

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $2.00 for postage and handling. An invoice will be mailed to you under separate cover.

Don't waste any more time. Get organized now!

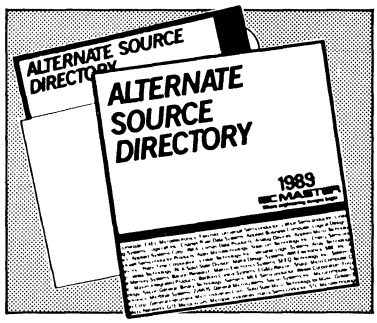
ICMASD...IC Alternate Source Directory

If you've used the IC MASTER, you know what the Alternate Source Directory is. Engineers tell us that it's one of the most valuable sections of the Master. The Alternate Source Directory...ASD...is now available in floppy disk form.



The electronic ASD is FAST! Just ask a question and the answer pops up in a split second.

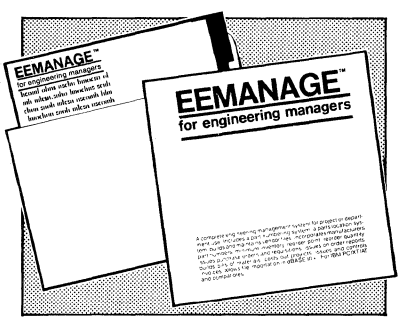
The electronic ASD is FLEXIBLE! You can add ICs and you can add comments.

You can add part numbers, prices, technical notes or anything else you like. You can customize the ASD to fit your needs and the needs of your company.

Order the Alternate Source Directory for your AT, XT or compatible. We'll send you two floppies and a very simple piece of printed documentation. Download the floppies and you're in business. All you need is a hard disk.

EEMANAGE...for engineering managers

Developed by the publishers of EEM/ Electronic Engineers Master, EEMANAGE is a software program designed to make life easier for engineers and engineering managers.



EEMANAGE does many things: 1. Develops Bills of Materials 2. Assigns Part Numbers logically 3. Manages Engineering Inventories 4. Issues Purchase Requisitions 5. Relieves Engineering Inventories 6. Manages a Parts Storage System 7. Issues Engineering Change Notices 8. Interfaces with dBaseIII+ Programs.

EEMANAGE is completely menu driven. It is simple to understand and operate. Any competent secretary can be up and running on EEMANAGE in minutes.

Order EEMANAGE for your AT, XT or compatible. We'll send you one floppy and brief, very user friendly documentation.

The basic price for ICMASD or EEMANAGE is $149.50* each and includes floppy disk(s) and complete program documentation.
